

# Properties Measurement of $H \rightarrow ZZ^* \rightarrow 4\ell$ and $Z \rightarrow 4\ell$ with ATLAS

Haijun Yang

(On behalf of the ATLAS Collaboration)

LHC mini-Workshop  
Zhejiang University, Hangzhou, China  
November 8-11, 2014

# Outline

- **Discovery of the Higgs Boson**
- **Higgs Production and Decays at LHC**
- **Event Selection of  $H \rightarrow ZZ^* \rightarrow 4\ell$**
- **Higgs Properties : mass, width, spin, parity, couplings**
- **Analysis of Single Resonance  $Z \rightarrow 4l$ : cross section, BR**
- **Summary**

# Standard Model and Discovery of the Higgs

Higgs boson is proposed to responsible for the electroweak symmetry breaking, particles acquire mass when interacting with the Higgs field.

- The Higgs boson was discovered by ATLAS and CMS at LHC in July, 2012.
- F. Englert and P. Higgs won the Nobel Prize in Physics in 2013.

# CERN's Large Hadron Collider (LHC)

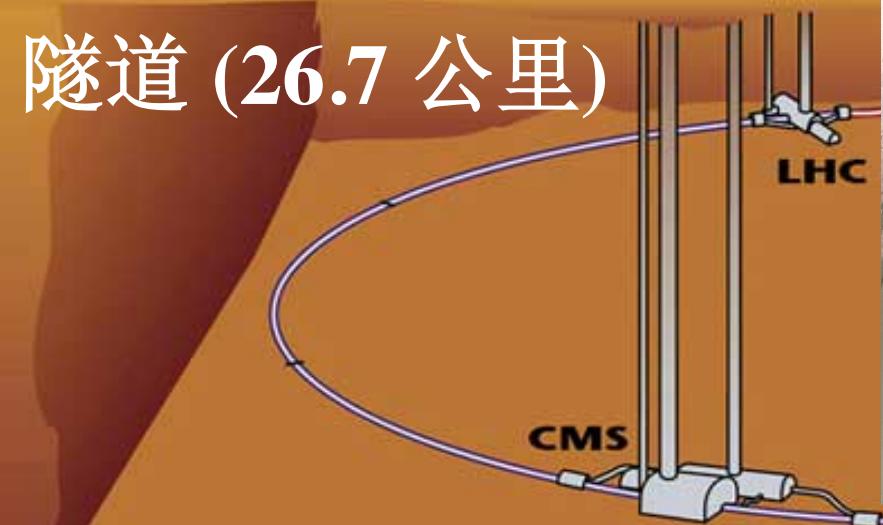

LHC is the world's largest collider (7-14 TeV)

ATLAS Collaboration (38 countries, 174 institutions, ~ 3000)

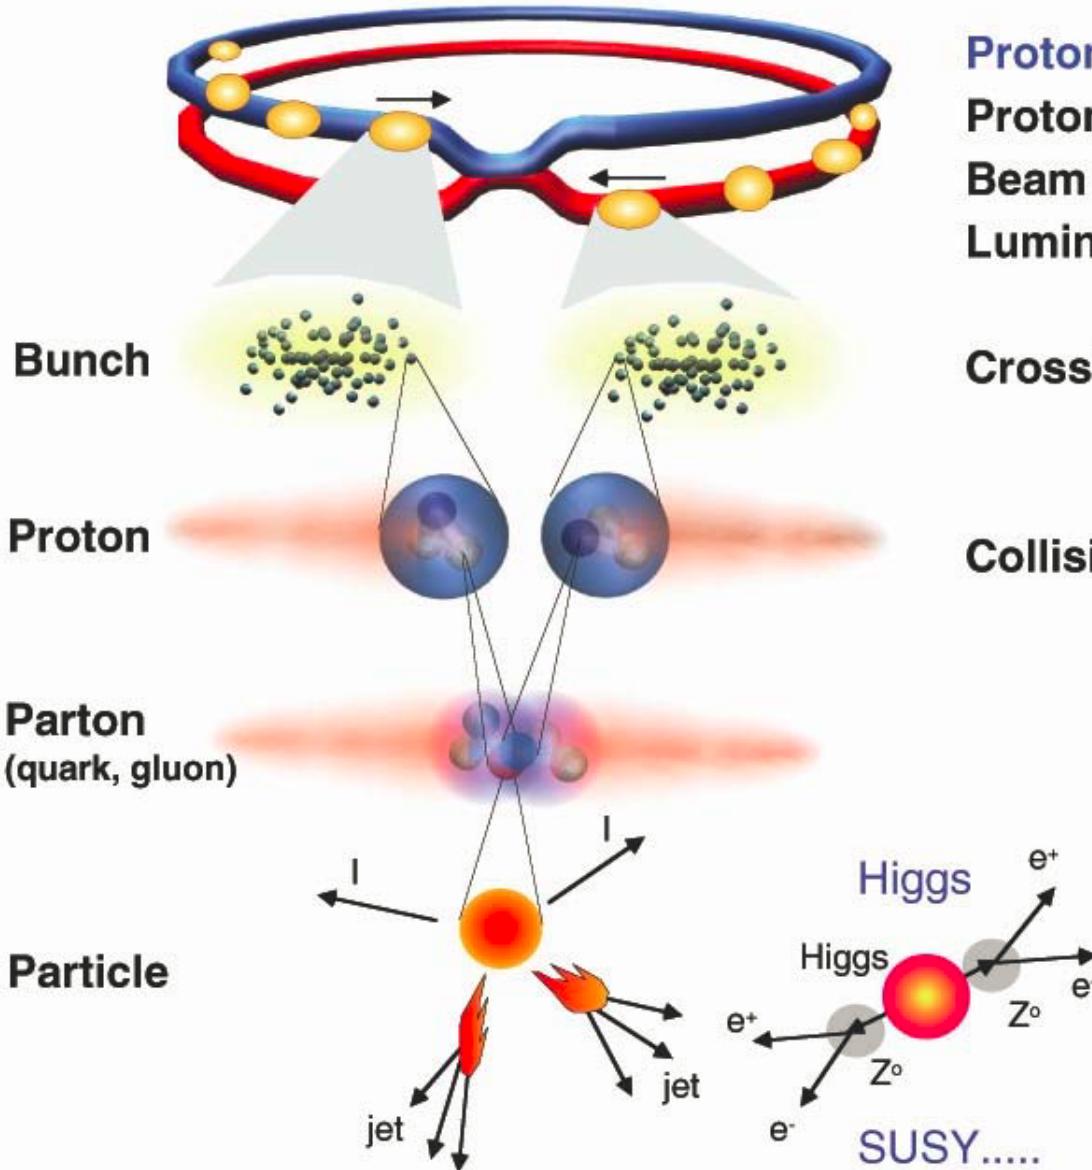

CMS Collaboration (41 countries, 179 institutions, ~3300)

隧道 (26.7 公里)

# LHC: Proton-Proton Collisions

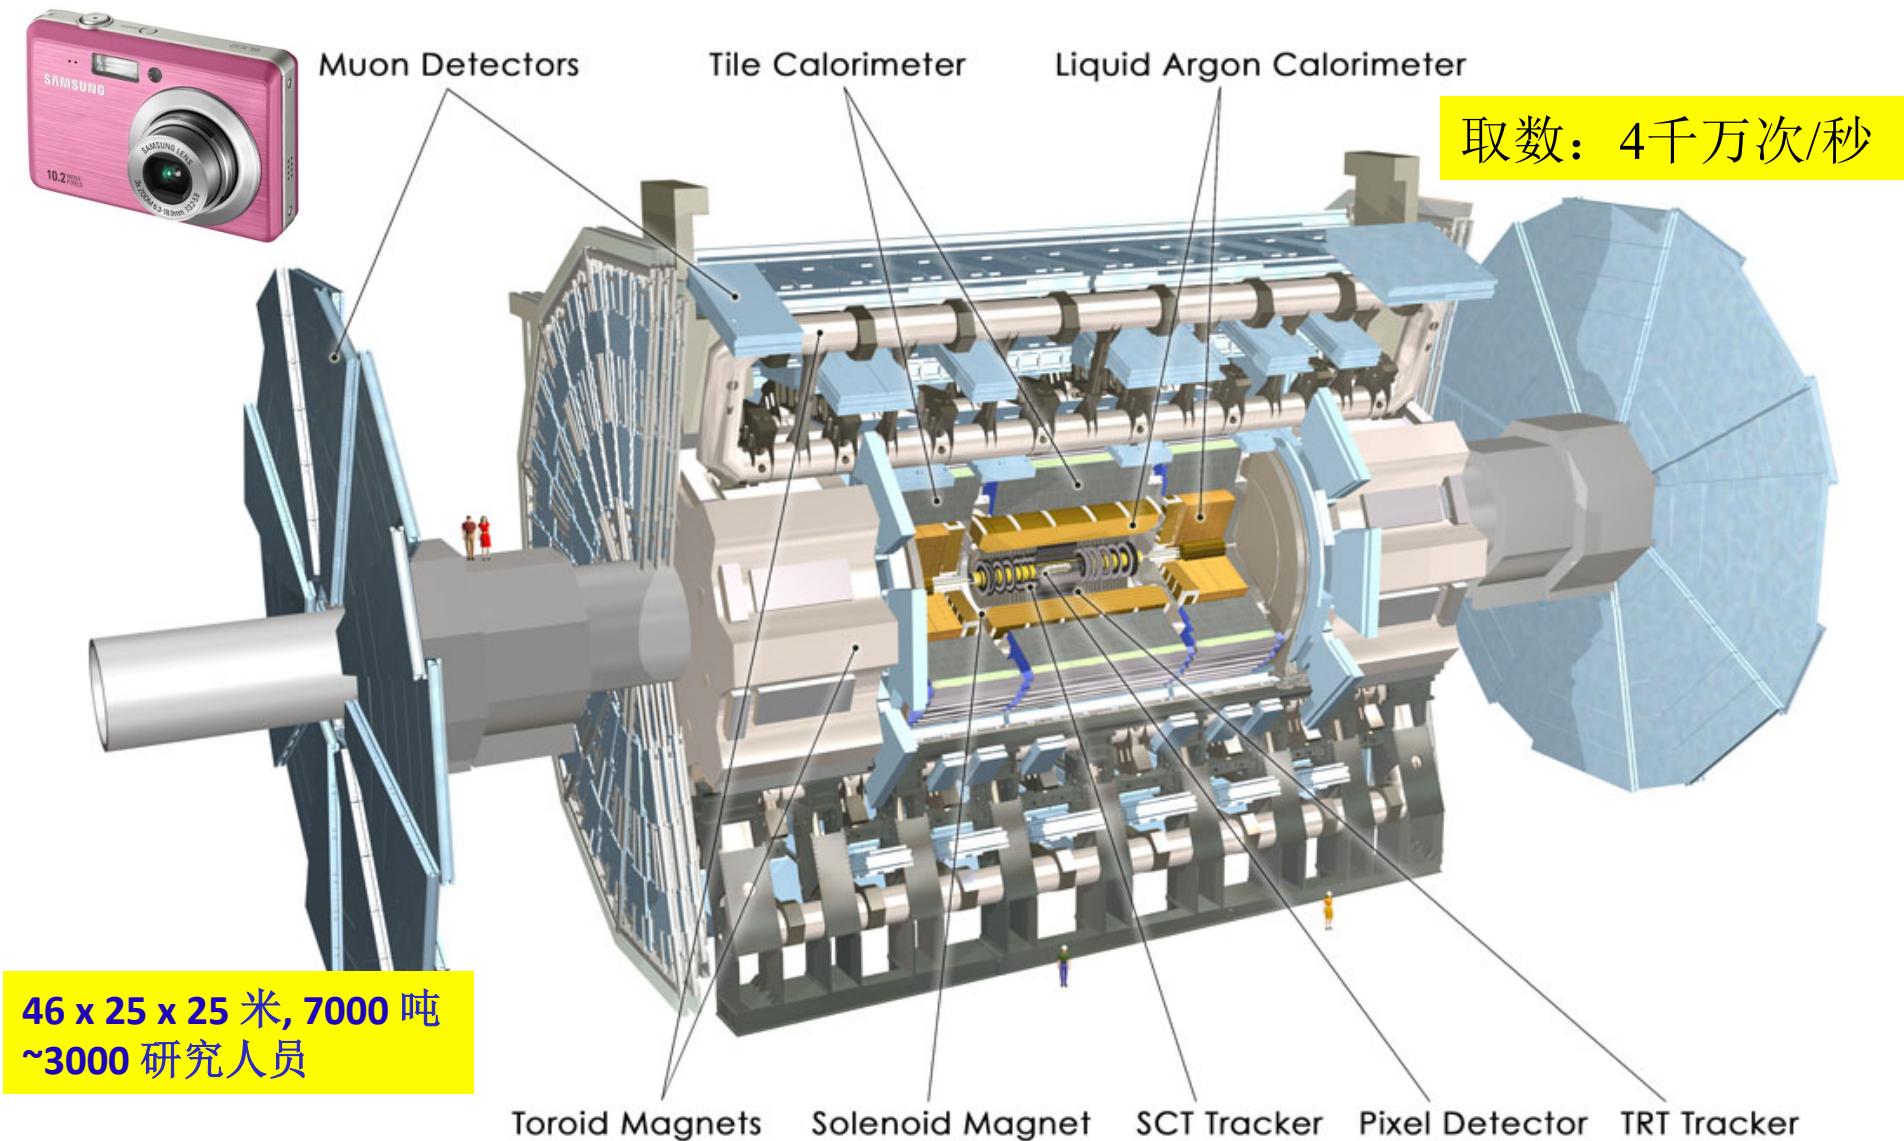

Proton-Proton	2835 bunch/beam
Protons/bunch	$10^{11}$
Beam energy	7 TeV ( $7 \times 10^{12}$ eV)
Luminosity	$10^{34} \text{ cm}^{-2} \text{ s}^{-1}$
Crossing rate	40 MHz
Collisions	$\approx 10^7 - 10^9 \text{ Hz}$

**Major challenge:**  
Higgs  $\rightarrow ZZ^*$   $\rightarrow 4l$  产生  
几率为10万亿分之一

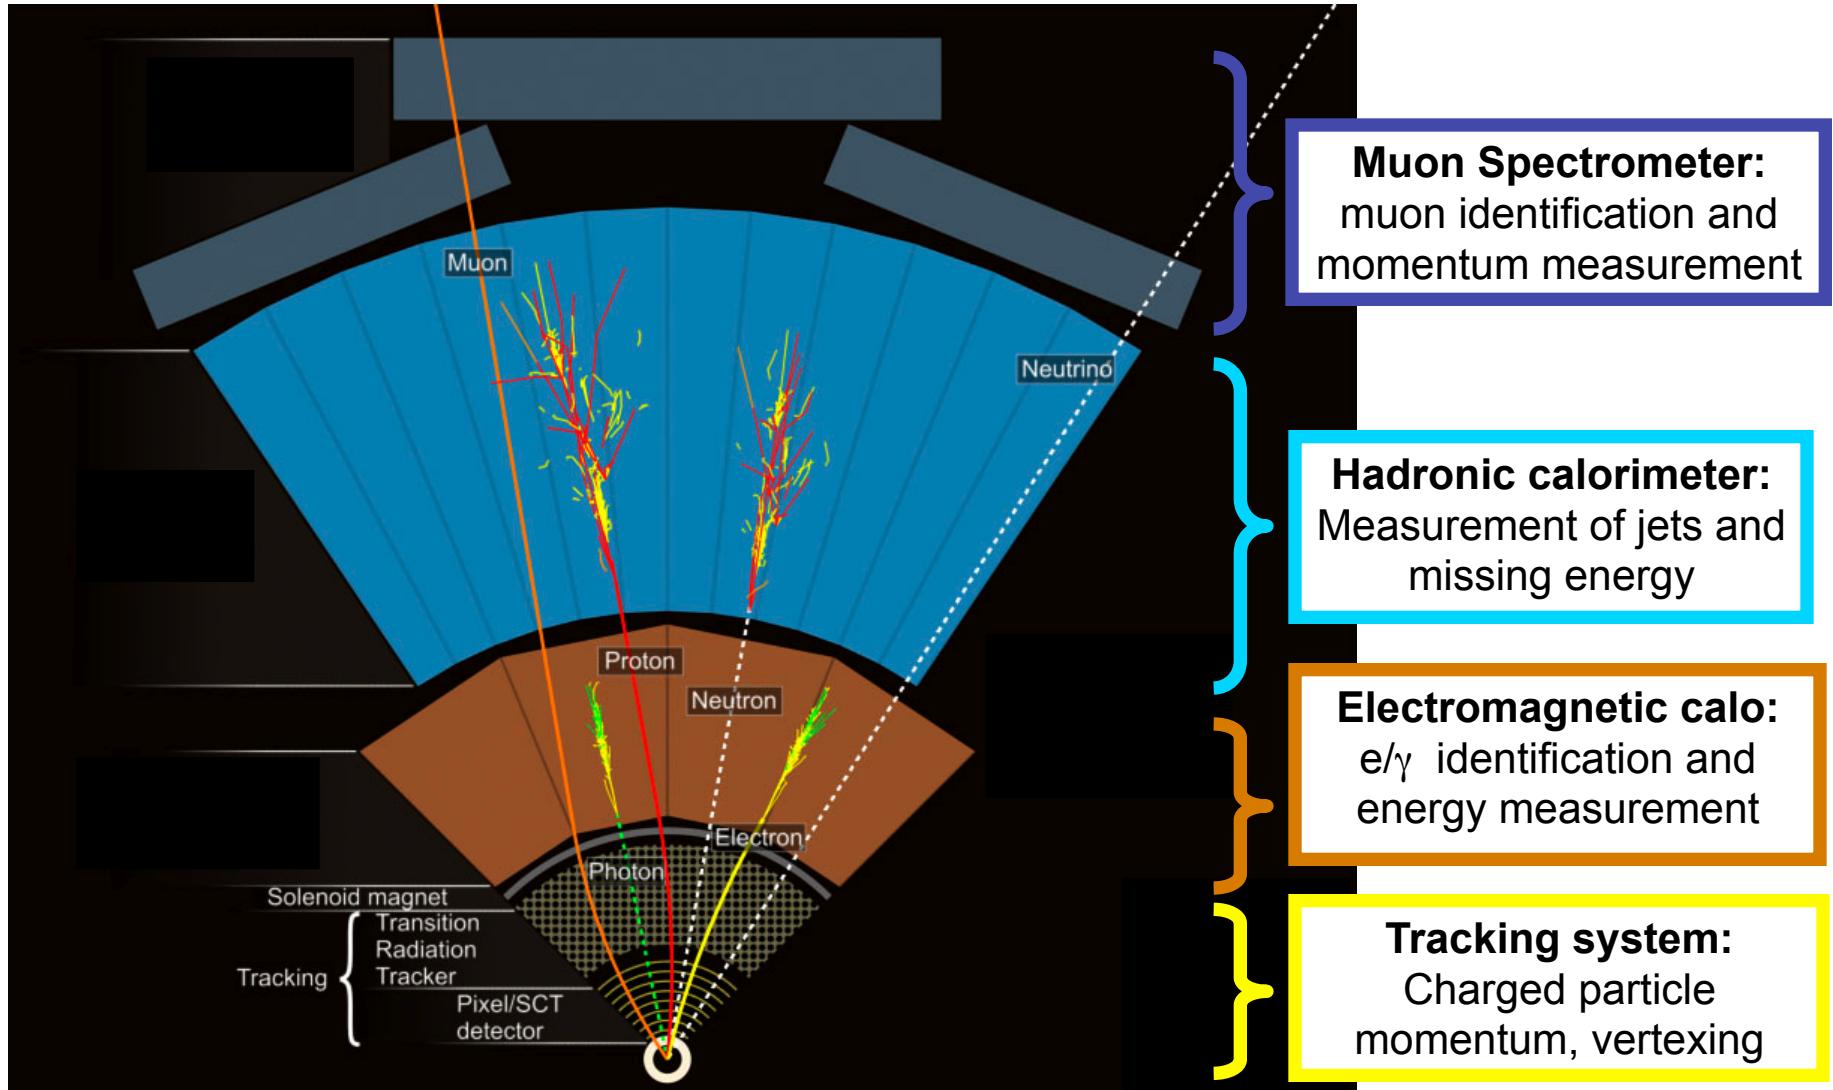

Selection of 1 in  
10,000,000,000,000

# The ATLAS Detector: Huge Camera

# Particle Detection

- Different particles have different signatures in detectors

# ATLAS Data Samples

## □ 7 TeV data samples (2011)

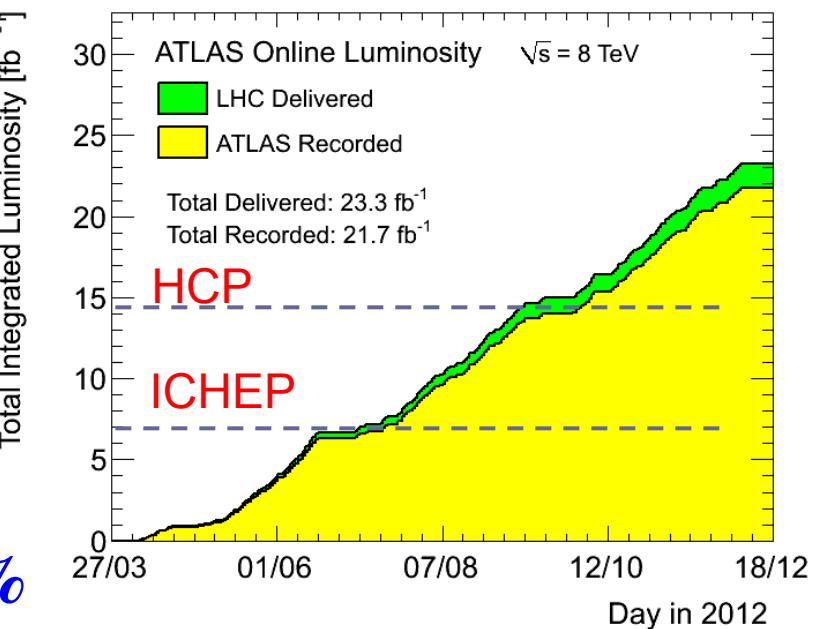

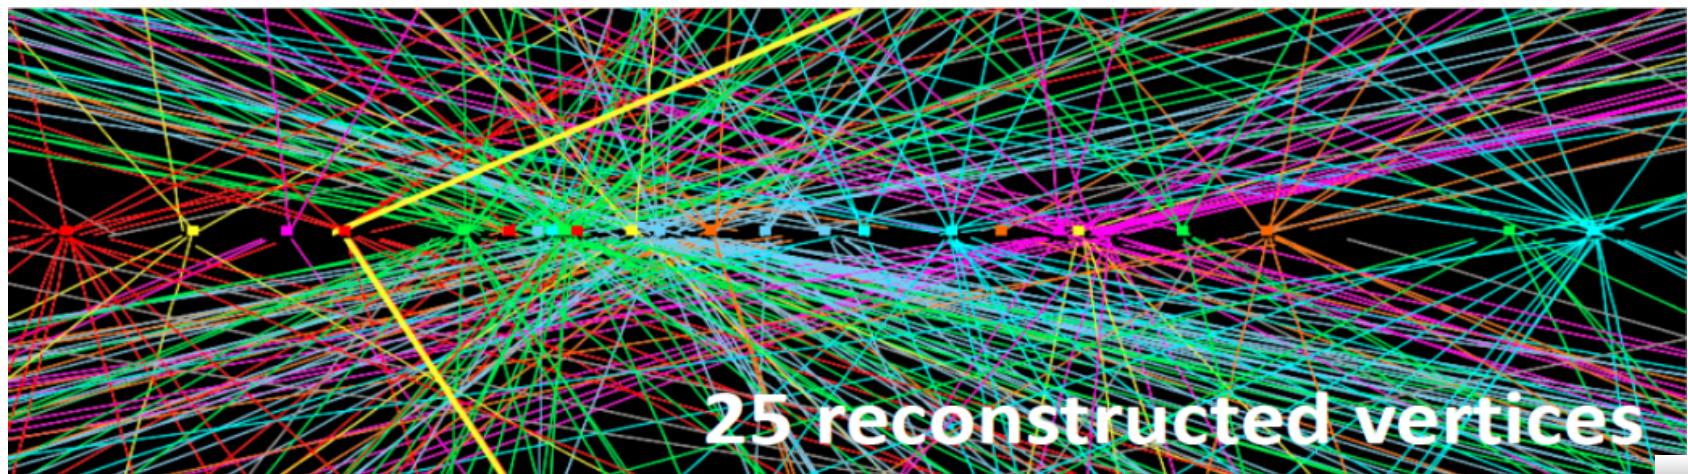

- $4.5 \text{ fb}^{-1}$  for physics analysis
- Peak luminosity  $3.6 \times 10^{33} \text{ cm}^{-2} \text{s}^{-1}$

## □ 8 TeV data samples (2012)

- $20.3 \text{ fb}^{-1}$  for physics analysis
- Peak luminosity  $7.7 \times 10^{33} \text{ cm}^{-2} \text{s}^{-1}$

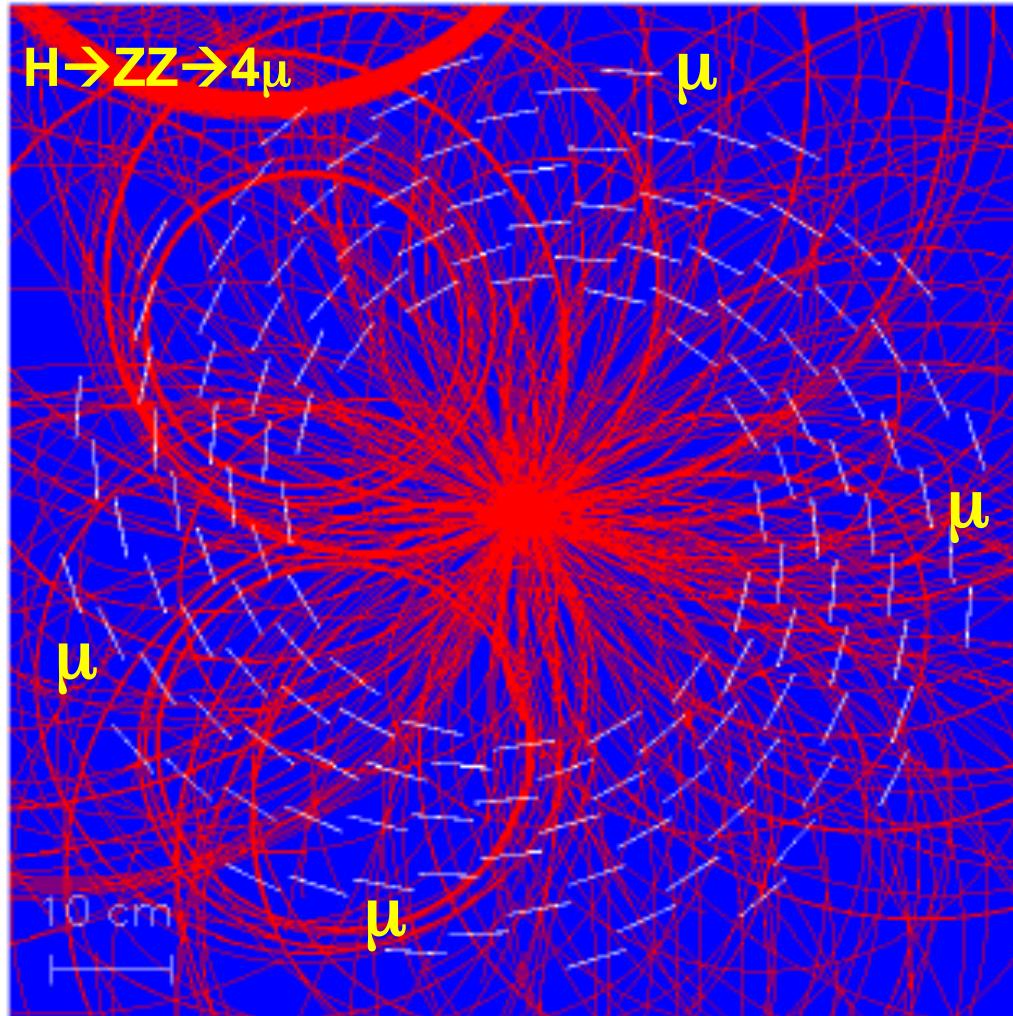

## □ Data-taking efficiency: ~95.5%

## □ Significant pileup events

# Major Challenge (Large Pileup)

- Large pileup events result in big challenge to the detector, reconstruction and particle identification (**eg. e,  $\gamma$ ,  $\tau$ , b**) !

# Boosted Decision Trees (BDT)

最先 (2004) 提出和应用先进的BDT方法用于粒子鉴别和事例识别。  
BDT方法应用于希格斯粒子的寻找，显著提高希格斯粒子发现的灵敏度。

# Higgs Boson Production at LHC

Gluon-gluon fusion  $gg \rightarrow H$  and vector-boson fusion  $qq \rightarrow qqH$  are dominant

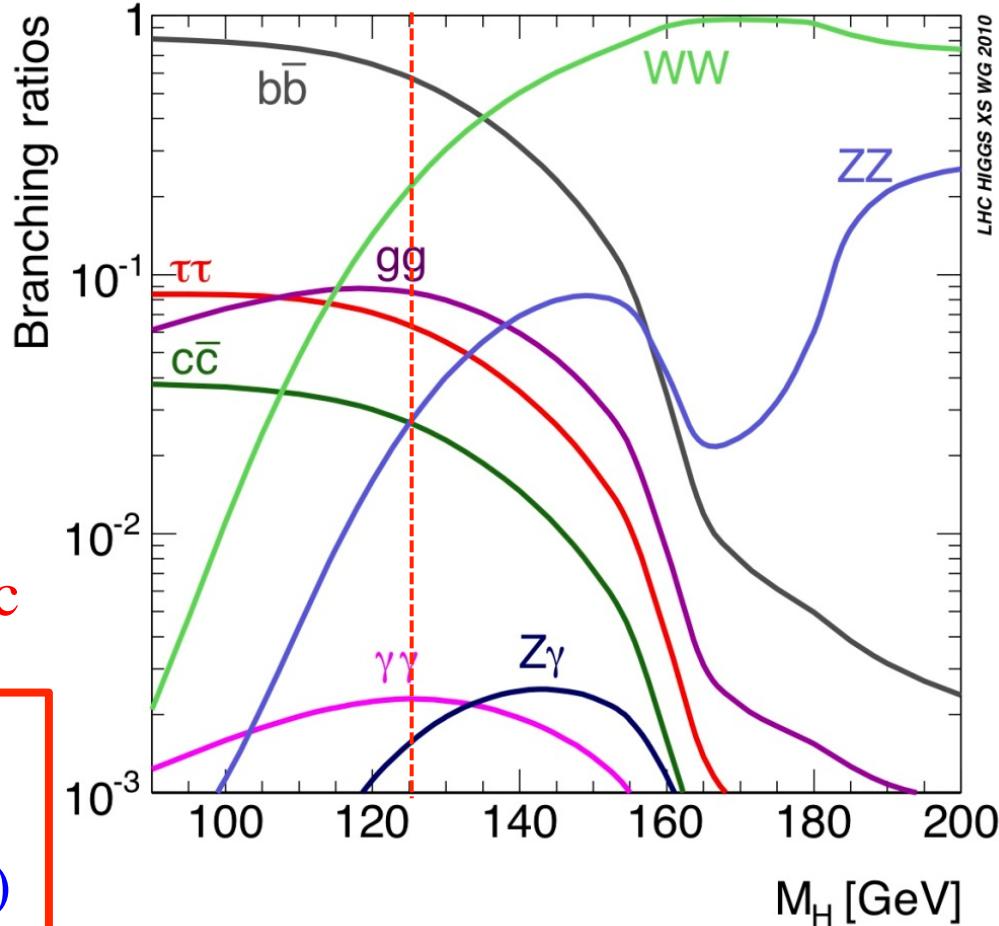

@125 GeV:  $\sigma_{ggH} = 19.5$  pb,  $\sigma_{VBF} = 1.6$  pb,  
 $\sigma_{WH} = 0.70$  pb,  $\sigma_{ZH} = 0.39$  pb,  $\sigma_{ttH} = 0.13$  pb

# Higgs Boson Decay

## Higgs decay branching ratio at $m_H=125$ GeV

- $bb$ : 57.7% (huge QCD background)
- $WW$ : 21.5% (easy identification in di-lepton mode, complex background)
- $\tau\tau$ : 6.3% (complex final states with  $\tau$  leptonic and/or hadronic decays)
- $ZZ^*$ : 2.6% (“gold-plated”, clean signature of 4-lepton, high S/B, excellent mass peak)
- $\gamma\gamma$ : 0.23% (excellent mass resolution, high sensitivity)

$H \rightarrow ZZ^* \rightarrow 4l$  production rate:  
1 out of  $10^{13}$  collision events

# $H \rightarrow ZZ^* \rightarrow 4\ell$ Overview

## ❑ Extremely clean – “Gold-plated” channel

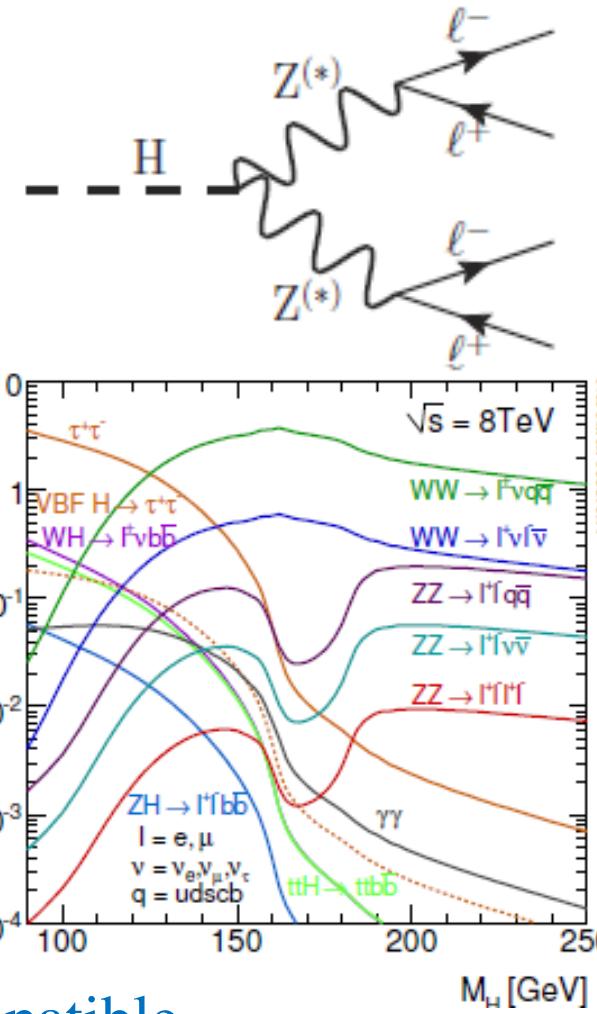

- Fully reconstructed final states
- Good mass resolution ( $\sim 1.6\text{-}2.4$  GeV)
- High S/B ratio ( $\sim 1\text{-}2$ )
- Low decay branching fraction

## ❑ Currently statistically limited

- $4.5 \text{ fb}^{-1}$  @ 7 TeV +  $20.3 \text{ fb}^{-1}$  @ 8 TeV
- Expect 68 SM  $H \rightarrow ZZ^* \rightarrow 4\ell$  ( $e, \mu$ ) events

## ❑ Properties measurement

- Higgs mass, width, spin, parity, couplings.
- Critical to determine whether it is fully compatible with the SM Higgs boson

# H $\rightarrow$ ZZ\* $\rightarrow$ 4l Event Selection

- Trigger match with single and/or di-lepton trigger
- Four sub-channels: 4e, 2e2 $\mu$ , 2 $\mu$ 2e, 4 $\mu$

---

## Event Pre-selection

---

### Electrons

“MultiLepton” quality GSF electrons with  $E_T > 7$  GeV and  $|\eta| < 2.47$

### Muons

combined or segment-tagged muons with  $p_T > 6$  GeV and  $|\eta| < 2.7$

Maximum one calo-tagged or standalone muon

calo-tagged muons with  $p_T > 15$  GeV and  $|\eta| < 0.1$

standalone muons with  $p_T > 6$  GeV,  $2.5 < |\eta| < 2.7$  and  $\Delta R > 0.2$  from closest segment-tagged

---

## Event Selection

---

Kinematic Selection	<p>Require at least one quadruplet of leptons consisting of two pairs of same-flavour opposite-charge leptons fulfilling the following requirements:</p> <p><math>p_T</math> thresholds for three leading leptons in the quadruplet 20, 15 and 10 GeV</p> <p>Leading di-lepton mass requirement <math>50 \text{ GeV} &lt; m_{12} &lt; 106 \text{ GeV}</math></p> <p>Sub-leading di-lepton mass requirement <math>m_{threshold} &lt; m_{34} &lt; 115 \text{ GeV}</math></p> <p>Remove quadruplet if alternative same-flavour opposite-charge di-lepton gives <math>m_{\ell\ell} &lt; 5 \text{ GeV}</math> <math>\Delta R(\ell, \ell') &gt; 0.10(0.20)</math> for all same (different) flavour leptons in the quadruplet.</p>
Isolation	<p>Lepton track isolation (<math>\Delta R = 0.20</math>): <math>\Sigma p_T / p_T &lt; 0.15</math></p> <p>Electron calorimeter isolation (<math>\Delta R = 0.20</math>) : <math>\Sigma E_T / E_T &lt; 0.20</math></p> <p>Muon calorimeter isolation (<math>\Delta R = 0.20</math>) : <math>\Sigma E_T / E_T &lt; 0.30</math></p> <p>Stand-Alone muons calorimeter isolation (<math>\Delta R = 0.20</math>) : <math>\Sigma E_T / E_T &lt; 0.15</math></p>
Impact Parameter Significance	<p>Apply impact parameter significance cut to all leptons of the quadruplet.</p> <p>For electrons : <math>d_0 / \sigma_{d_0} &lt; 6.5</math></p> <p>For muons : <math>d_0 / \sigma_{d_0} &lt; 3.5</math></p>

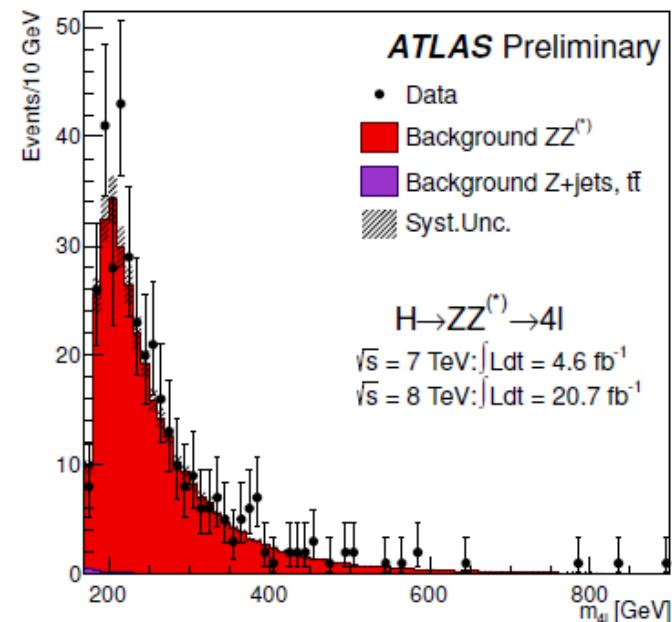

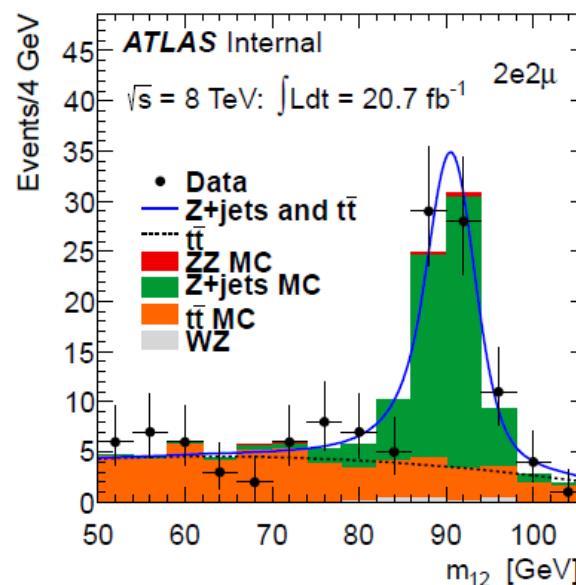

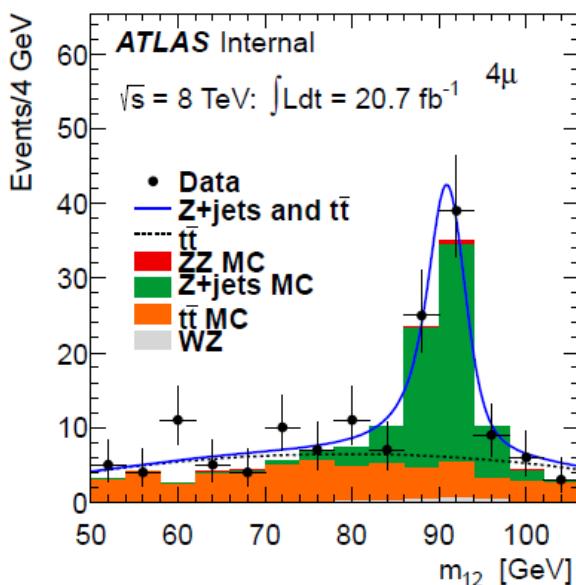

# Background Estimation

Main background is  $ZZ^{(*)}$  production

- MC simulation, scaled to theoretical cross section

Reducible backgrounds:

- $Zb\bar{b}$ ,  $Z + \text{light jets}$ ,  $t\bar{t}$
- Estimated using data-driven methods
  - Define background-enriched/signal-depleted control regions
  - Extrapolate to signal region using transfer factors

- Estimates agree well with data in control region where isolation and  $d_0$  requirements are removed for subleading pair

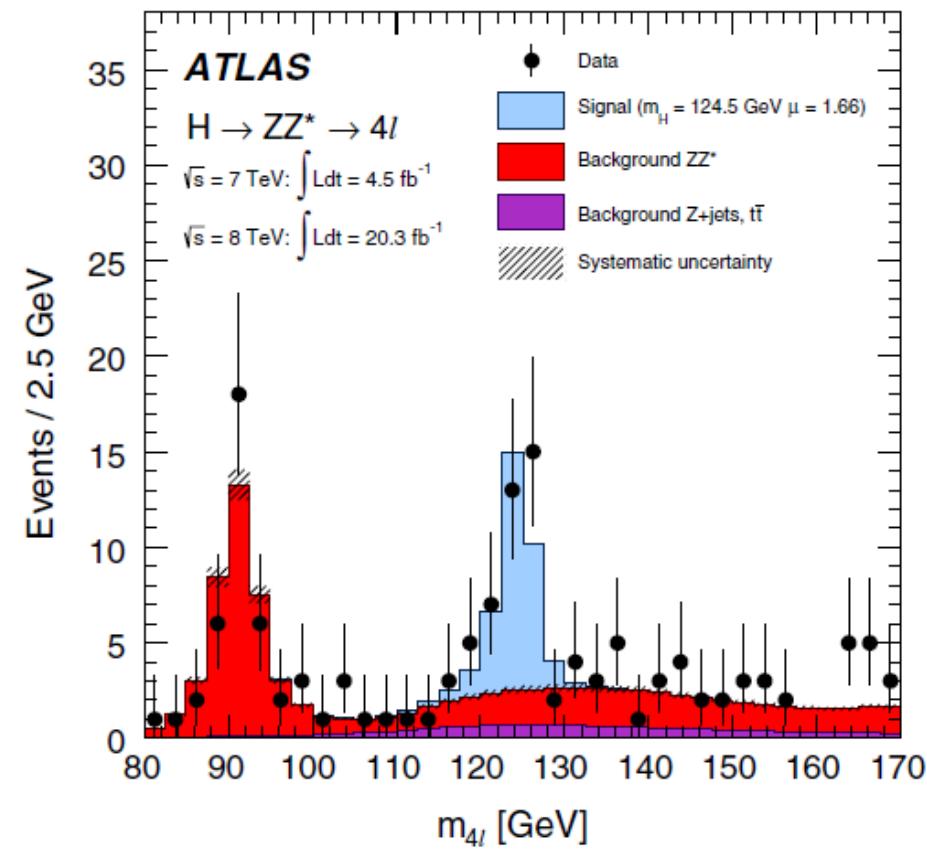

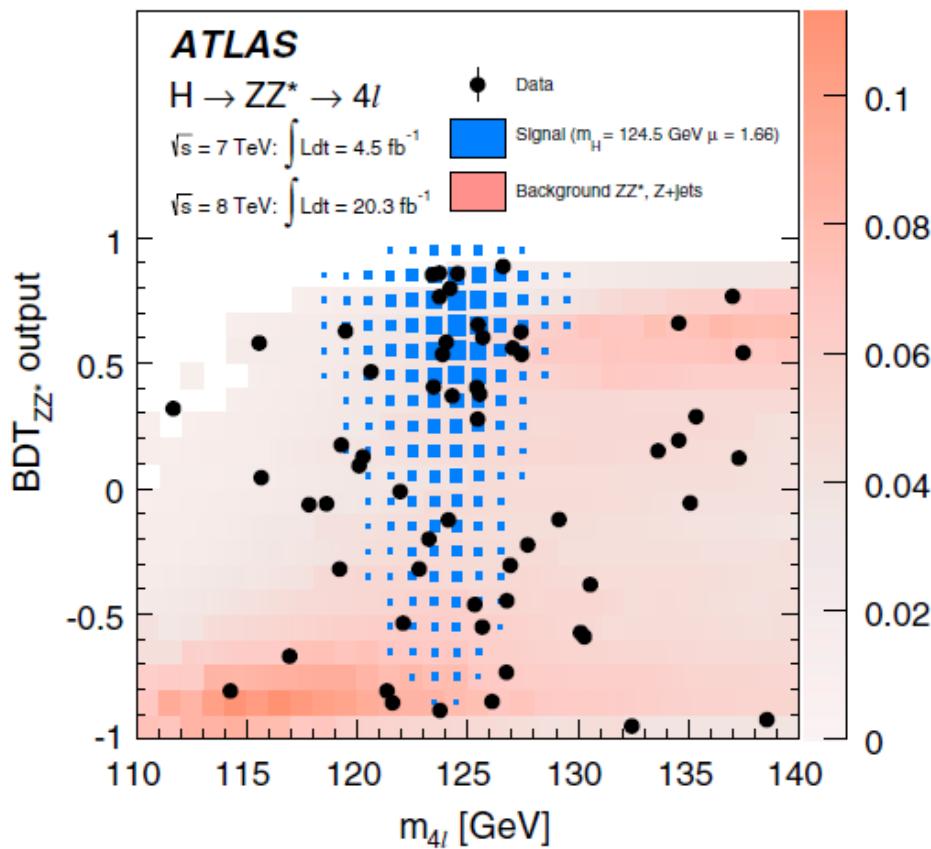

# Selected Higgs Candidates

TABLE III. The number of events expected and observed for a  $m_H = 125$  GeV hypothesis for the four-lepton final states. The second column shows the number of expected signal events for the full mass range. The other columns show the number of expected signal events, the number of  $ZZ^*$  and reducible background events, and the signal-to-background ratio ( $s/b$ ), together with the numbers of observed events, in a window of  $120 < m_{4\ell} < 130$  GeV for  $4.5 \text{ fb}^{-1}$  at  $\sqrt{s} = 7 \text{ TeV}$  and  $20.3 \text{ fb}^{-1}$  at  $\sqrt{s} = 8 \text{ TeV}$  as well as for the combined sample.

Final state	Signal Full mass range	Signal	$ZZ^*$	$Z + \text{jets}, t\bar{t}$	$s/b$	Expected	Observed

# Candidates of 4-lepton

- $\text{BR}(H \rightarrow ZZ^*) = 2.63\%$ ,  $\text{BR}(ZZ^* \rightarrow 4l) = 0.45\%$
- About 68  $H \rightarrow ZZ^* \rightarrow 4l$  events produced
- Observed 37 candidates with 16 Higgs  $\rightarrow ZZ^* \rightarrow 4l$  signal

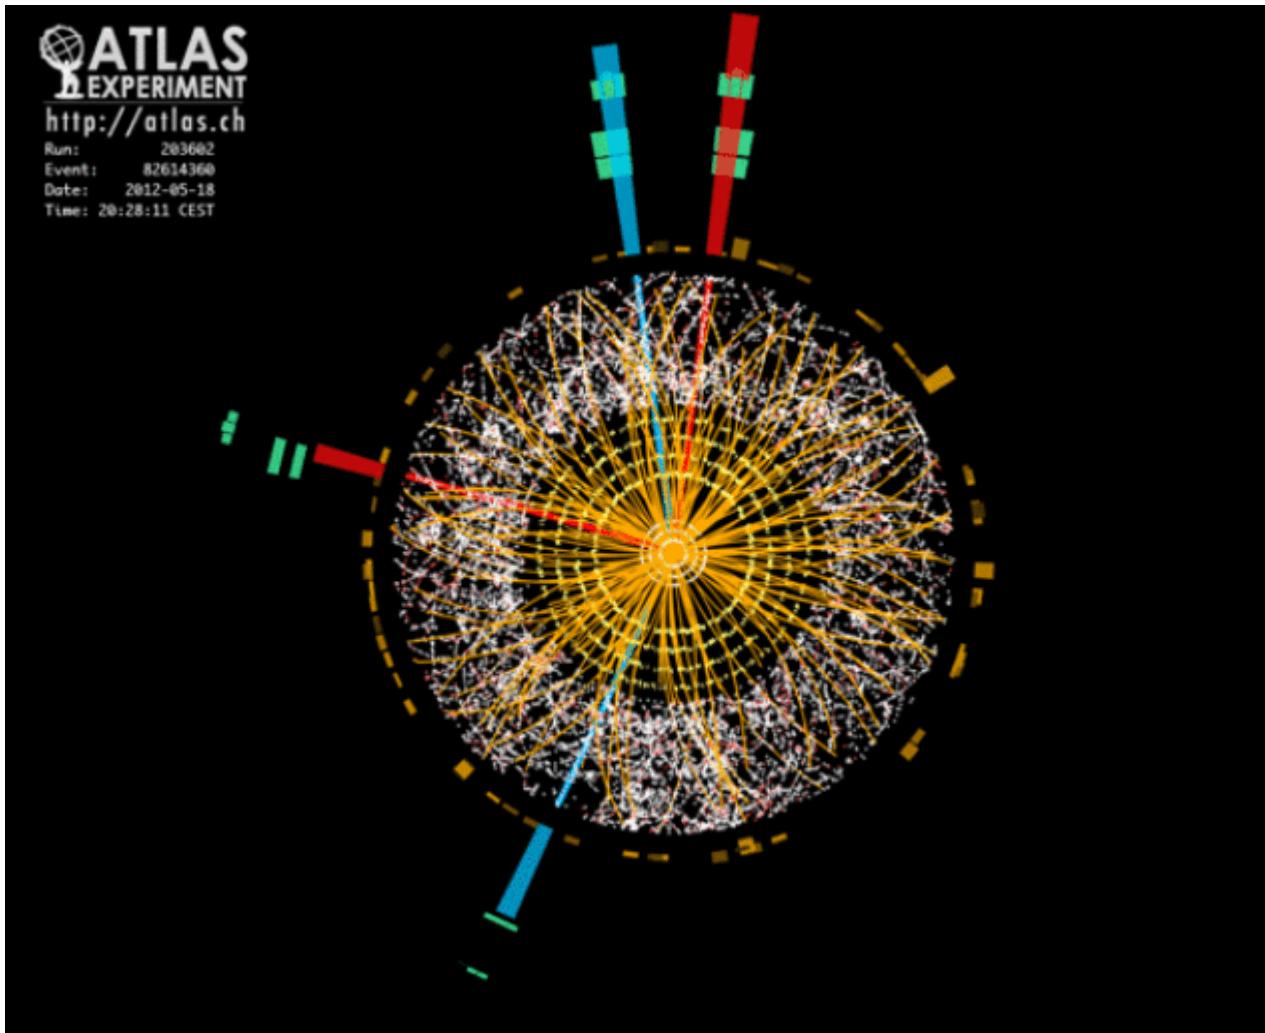

# ATLAS $H \rightarrow ZZ^* \rightarrow 4\mu$ Candidate

□  $M_{4\mu} = 125.1 \text{ GeV}, M_{12} = 86.3 \text{ GeV}, M_{34} = 31.6 \text{ GeV}$

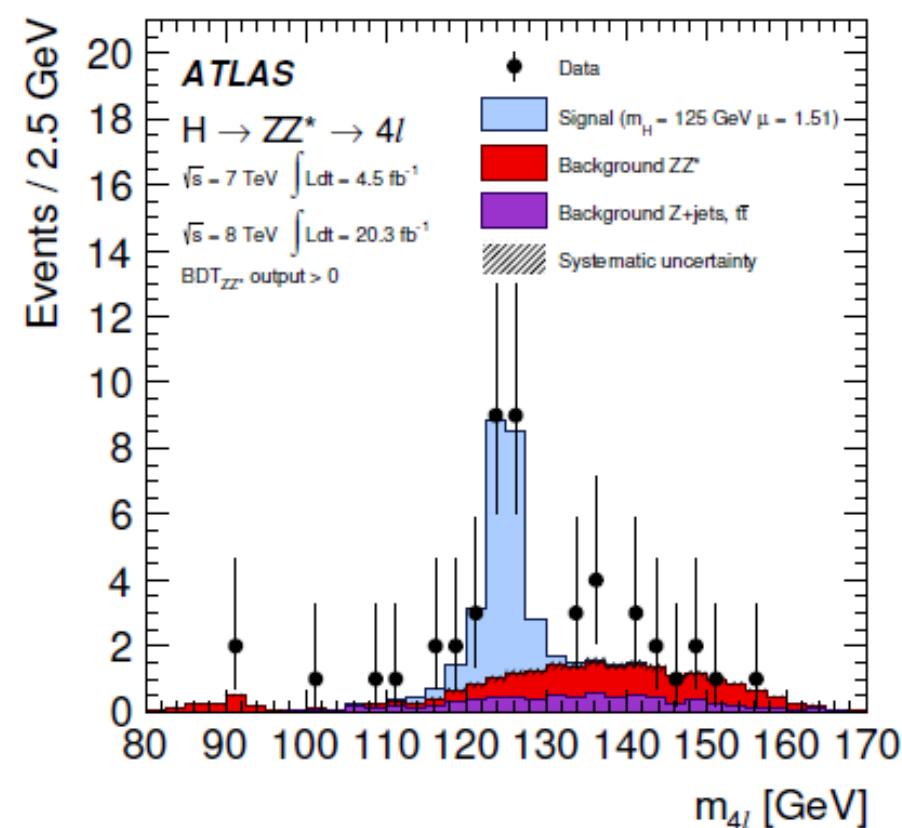

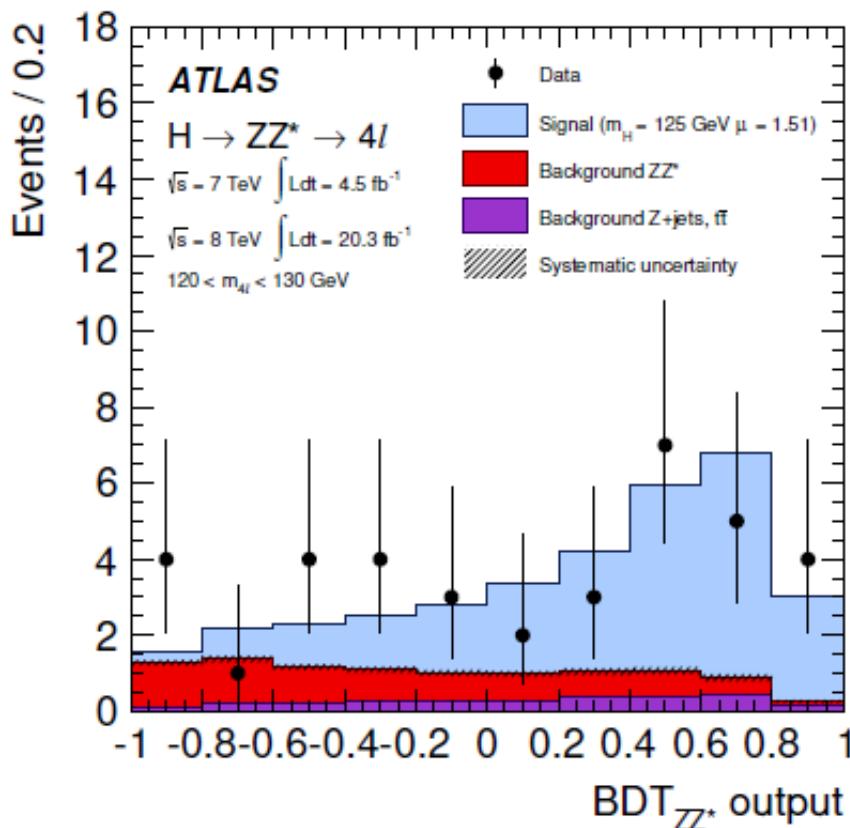

# Higgs $\rightarrow ZZ^* \rightarrow 4l$ Candidates Evolution

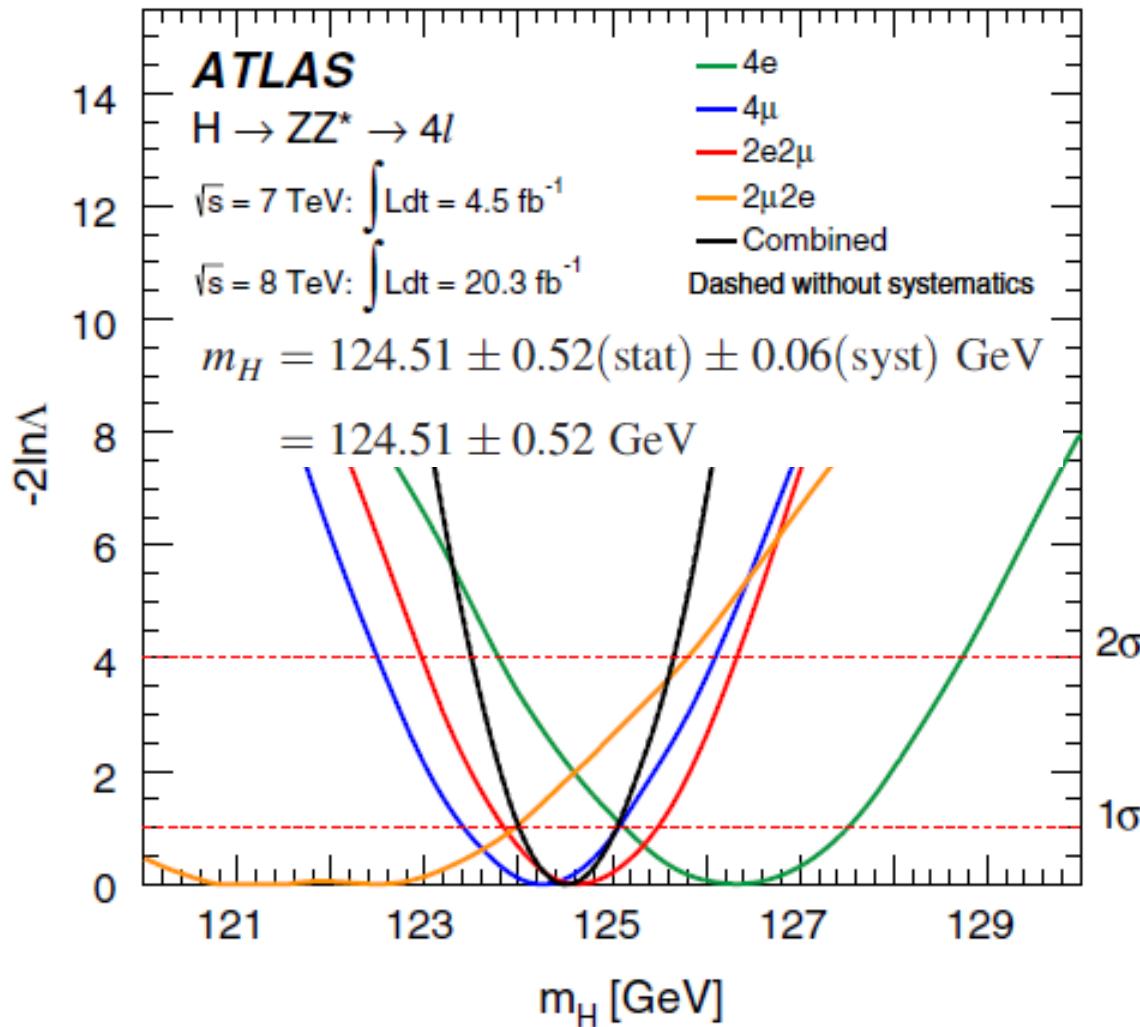

# Candidates of 4-lepton

- Left:  $BDT_{ZZ^*}$  output with requirement of  $120 < m_{4l} < 130 \text{ GeV}$   
→ Right:  $m_{4l}$  output with requirement of  $BDT_{ZZ^*} > 0$

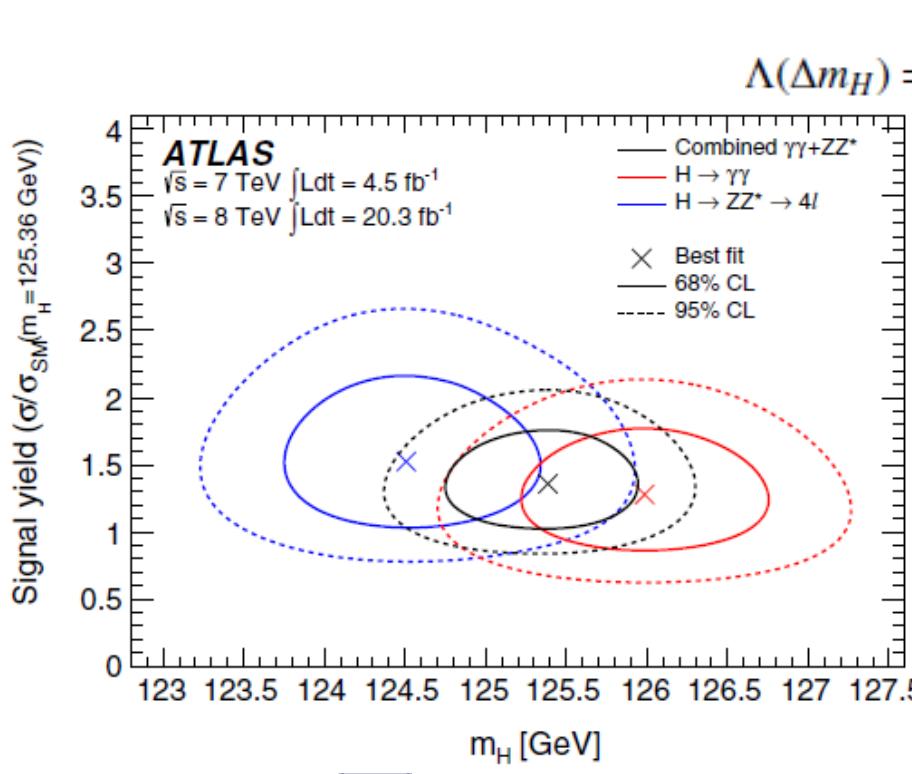

# Higgs Mass Measurement

- Two dimensional (2D) fit to  $m_{4l}$  and  $\text{BDT}_{ZZ^*}$  based on profile likelihood method to obtain Higgs mass.

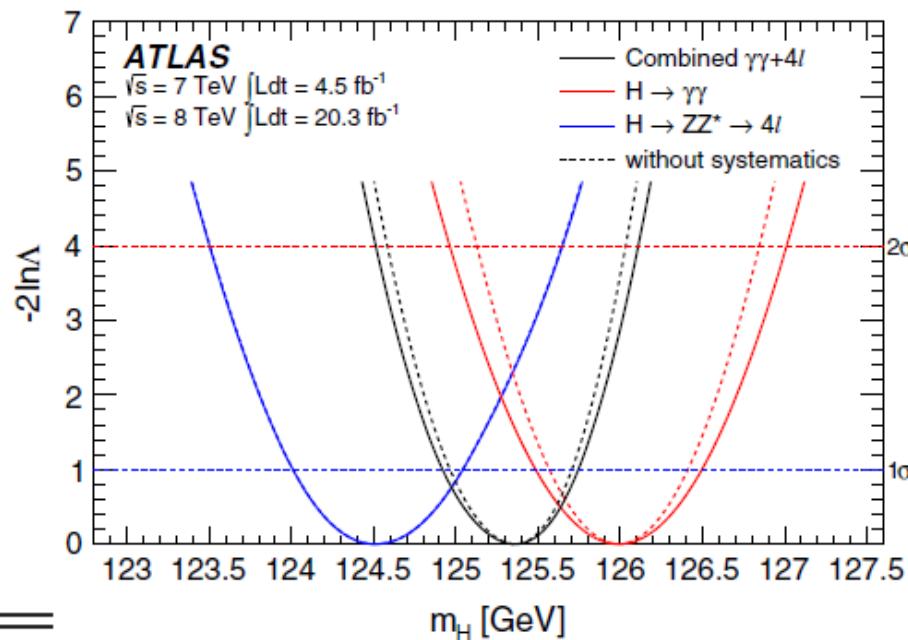

# Higgs Mass Measurements

$$\Lambda(\Delta m_H) = \frac{L(\Delta m_H, \hat{\mu}_{\gamma\gamma}(\Delta m_H), \hat{\mu}_{4\ell}(\Delta m_H), \hat{m}_H(\Delta m_H), \hat{\theta}(\Delta m_H))}{L(\hat{\Delta m}_H, \hat{\mu}_{\gamma\gamma}, \hat{\mu}_{4\ell}, \hat{m}_H, \hat{\theta})}$$

$$\Delta m_H = 1.47 \pm 0.67(\text{stat}) \pm 0.28(\text{syst}) \text{ GeV}$$

$$= 1.47 \pm 0.72 \text{ GeV}$$

Channel	Mass measurement [GeV]
$H \rightarrow \gamma\gamma$	$125.98 \pm 0.42(\text{stat}) \pm 0.28(\text{syst}) = 125.98 \pm 0.50$
$H \rightarrow ZZ^* \rightarrow 4\ell$	$124.51 \pm 0.52(\text{stat}) \pm 0.06(\text{syst}) = 124.51 \pm 0.52$
Combined	$125.36 \pm 0.37(\text{stat}) \pm 0.18(\text{syst}) = 125.36 \pm 0.41$

**It is compatible with  $\Delta M_H = 0$  at the level of 4.8%, 2.0 $\sigma$**

# Measurements of Higgs Signal Strength

→ Signal strength:  $\mu = 1.3 \pm 0.2$  (ATLAS)

→  $\mu = 0.8 \pm 0.14$  (CMS)

$$\mu = \frac{\sigma \cdot Br}{(\sigma \cdot Br)_{SM}}$$

CMS-HIG-13-005

Combined  
 $\mu = 0.80 \pm 0.14$

$H \rightarrow b\bar{b}$   
 $\mu = 1.15 \pm 0.62$

$H \rightarrow \tau\tau$   
 $\mu = 1.10 \pm 0.41$

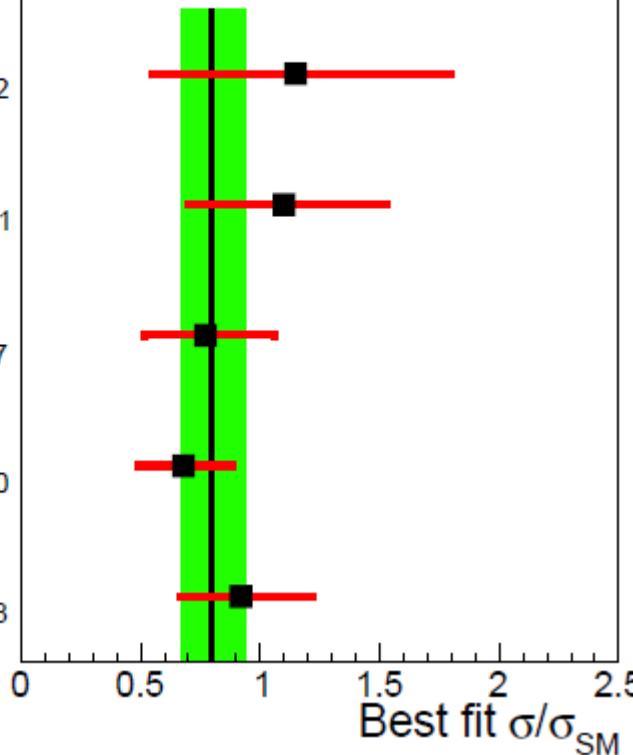

$H \rightarrow \gamma\gamma$   
 $\mu = 0.77 \pm 0.27$

$H \rightarrow WW$   
 $\mu = 0.68 \pm 0.20$

$H \rightarrow ZZ$   
 $\mu = 0.92 \pm 0.28$

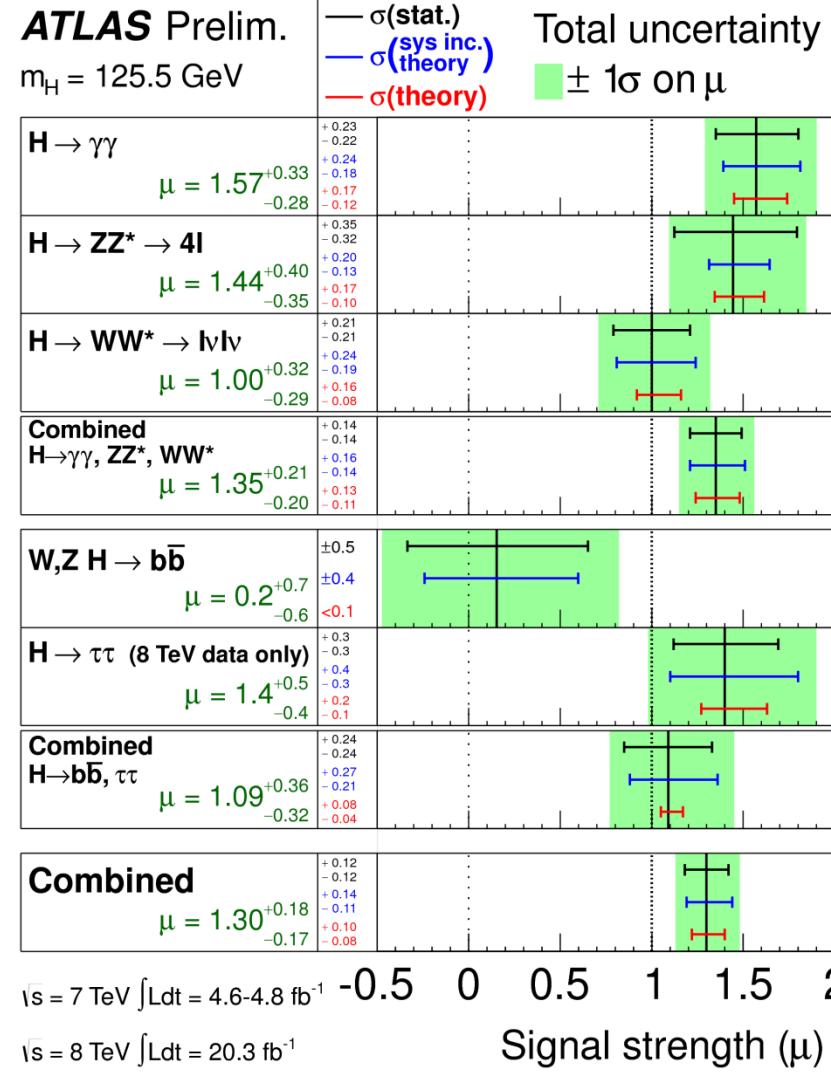

$\sqrt{s} = 7 \text{ TeV}, L \leq 5.1 \text{ fb}^{-1}$     $\sqrt{s} = 8 \text{ TeV}, L \leq 19.6 \text{ fb}^{-1}$

CMS Preliminary    $m_H = 125.7 \text{ GeV}$   
 $p_{SM} = 0.65$

ATLAS Prelim.

$m_H = 125.5 \text{ GeV}$

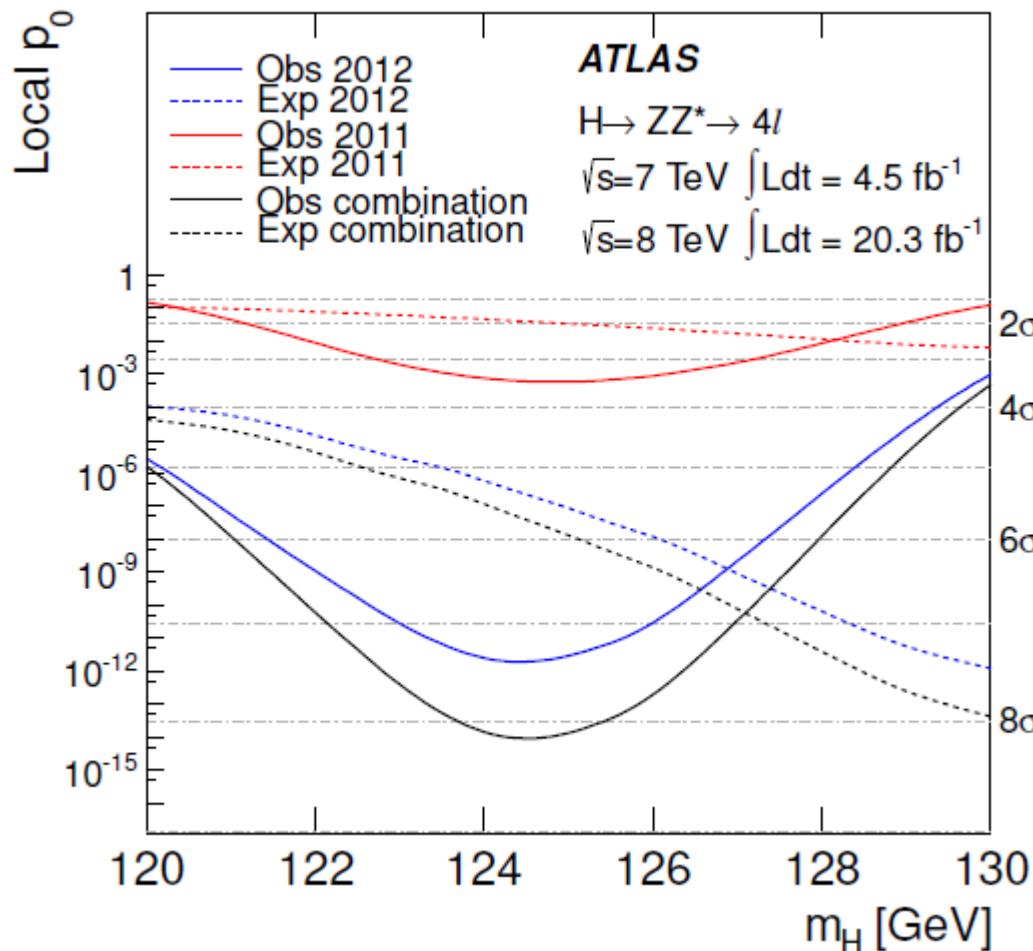

PLB 726 pp.88-119

ATLAS-CONF-2014-009

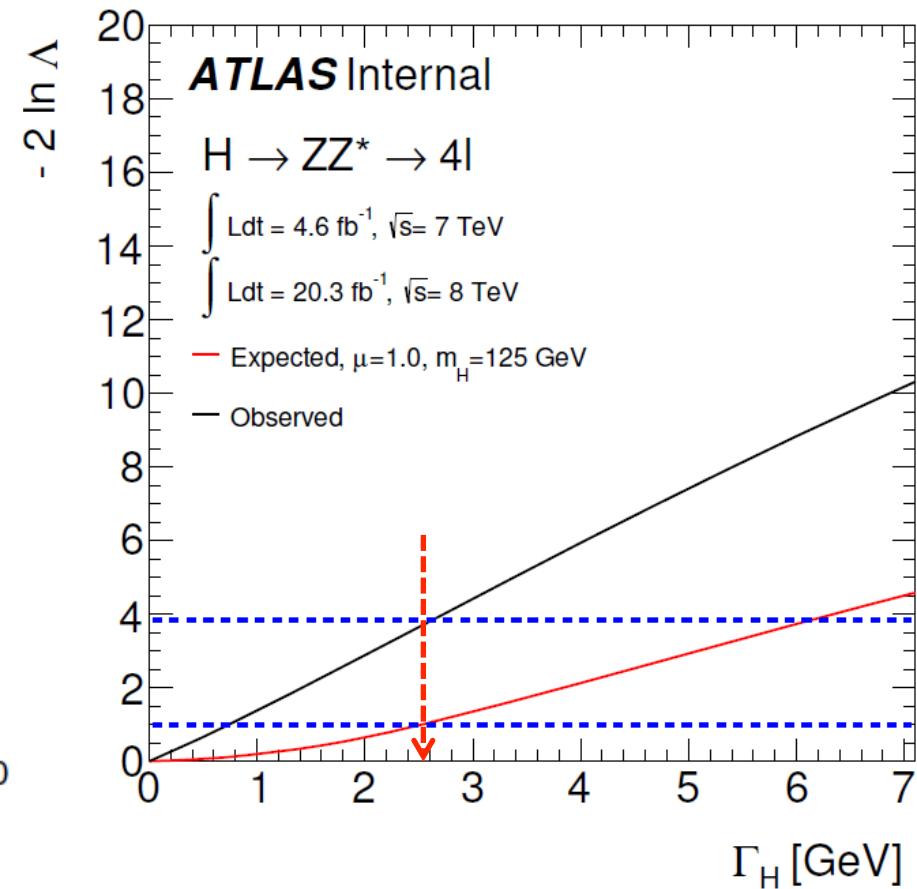

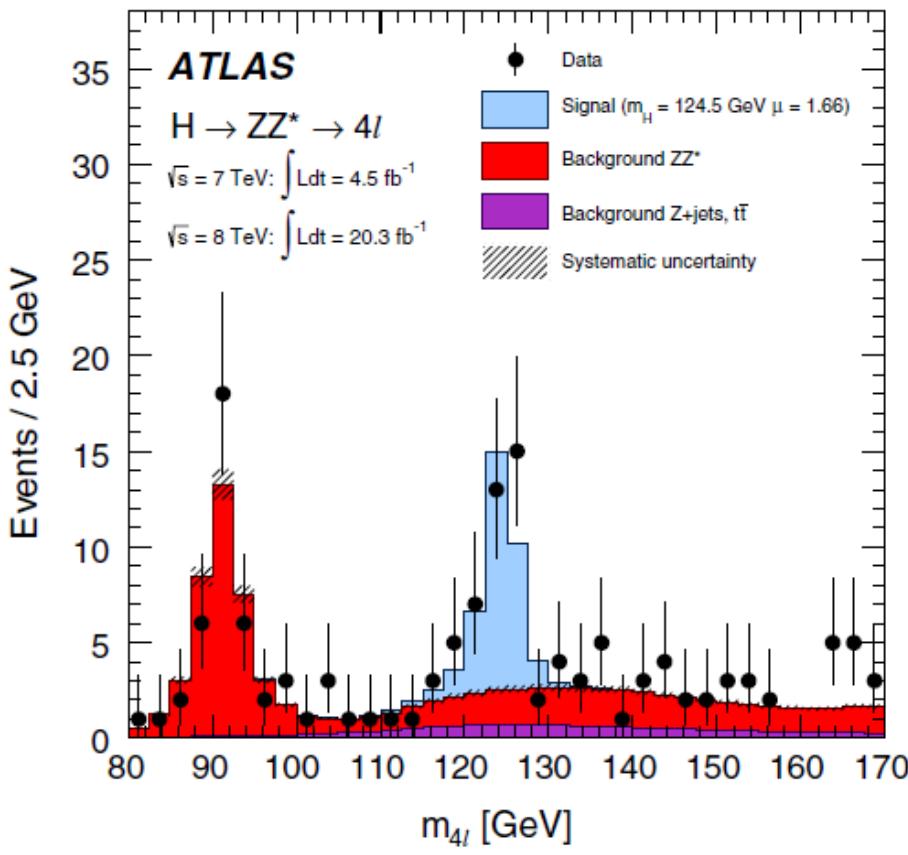

# Significance of $H \rightarrow ZZ^* \rightarrow 4l$

- Higgs mass  $m_H = 124.51$  and  $125.36$  GeV,  
Expected significances are  $5.8\sigma$  and  $6.2\sigma$ ,  
Observed significances are  $8.2\sigma$  and  $8.1\sigma$ .

# Direct Measurement of Higgs Width

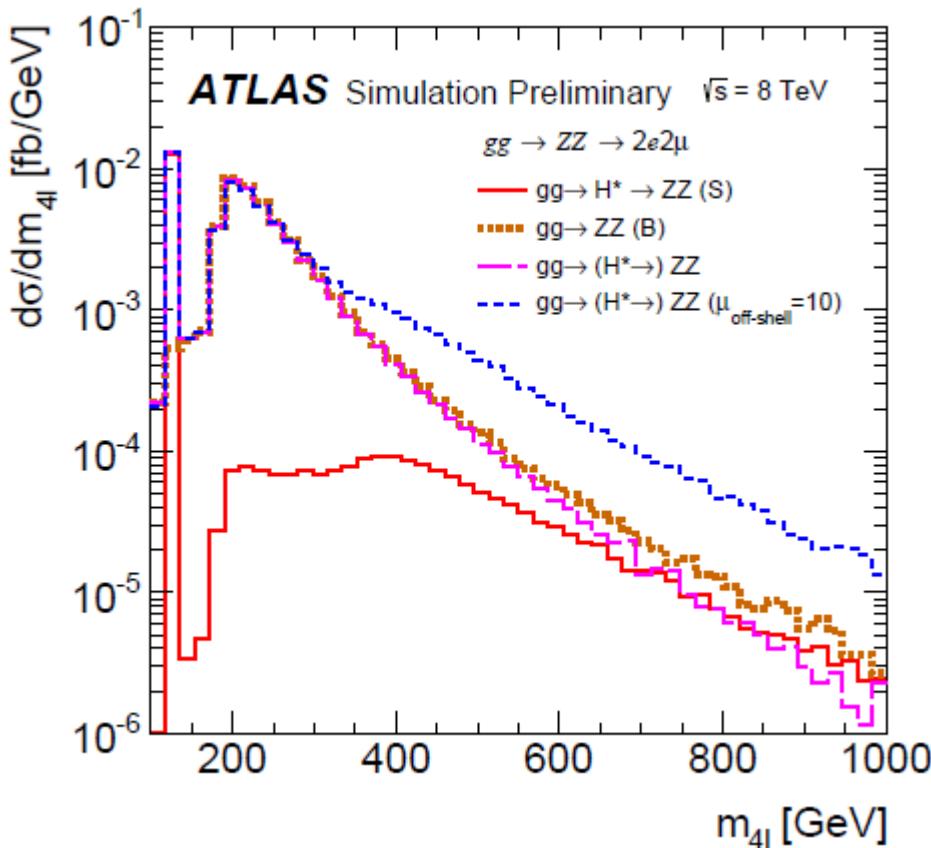

- Using per-event-error method, direct limit on the total width of the Higgs boson  $\Gamma_H < 2.6 \text{ GeV} @ 95\% \text{ C.L.}$

# Indirect Measurement of Higgs Width

- High-mass off-peak region of the  $H \rightarrow ZZ \rightarrow 4l$  channel above the  $2M_V$  threshold have sensitivity to Higgs production through off-shell and background interference effects.

(Ref: ATL-COM-PHYS-2014-1403)

$$\frac{\sigma_{\text{off-shell}}^{gg \rightarrow H^* \rightarrow VV}}{\sigma_{\text{on-shell, SM}}^{gg \rightarrow H^* \rightarrow VV}} = \mu_{\text{off-shell}} = \kappa_{g,\text{off-shell}}^2 \cdot \kappa_{V,\text{off-shell}}^2$$

$\mu_{\text{off-shell}}$  is the off-shell signal strength

$$\frac{\sigma_{\text{on-shell}}^{gg \rightarrow H \rightarrow VV}}{\sigma_{\text{on-shell, SM}}^{gg \rightarrow H \rightarrow VV}} = \mu_{\text{on-shell}} = \frac{\kappa_{g,\text{on-shell}}^2 \cdot \kappa_{V,\text{on-shell}}^2}{\Gamma_H/\Gamma_H^{\text{SM}}}$$

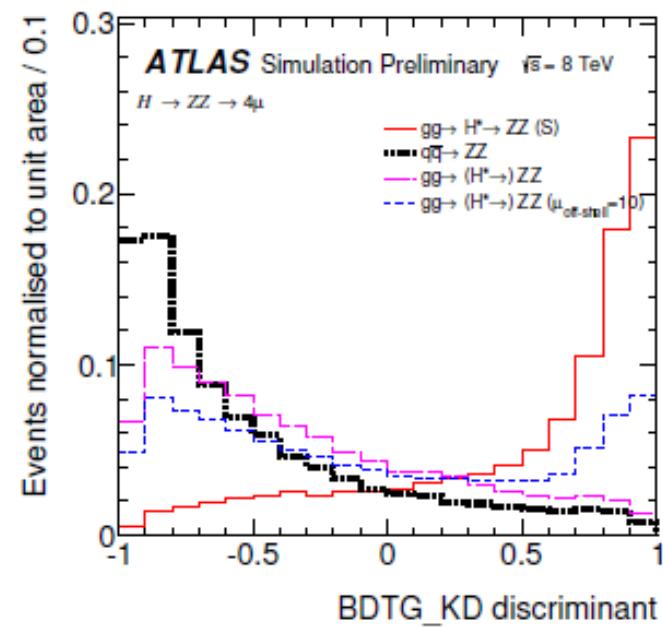

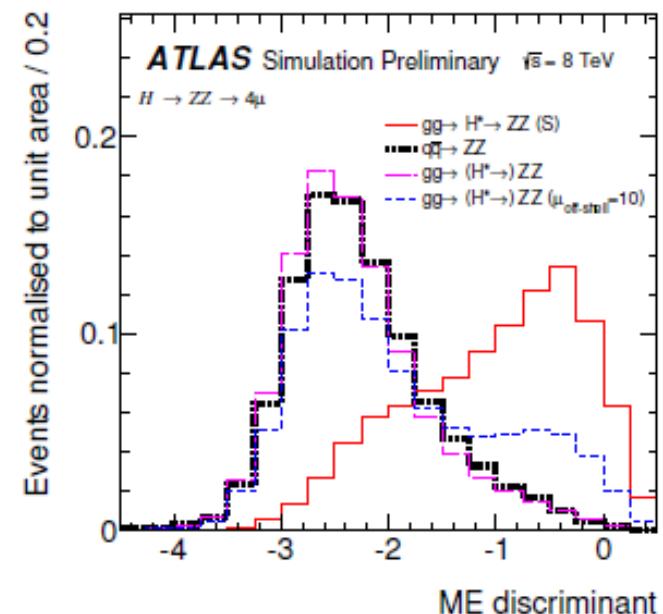

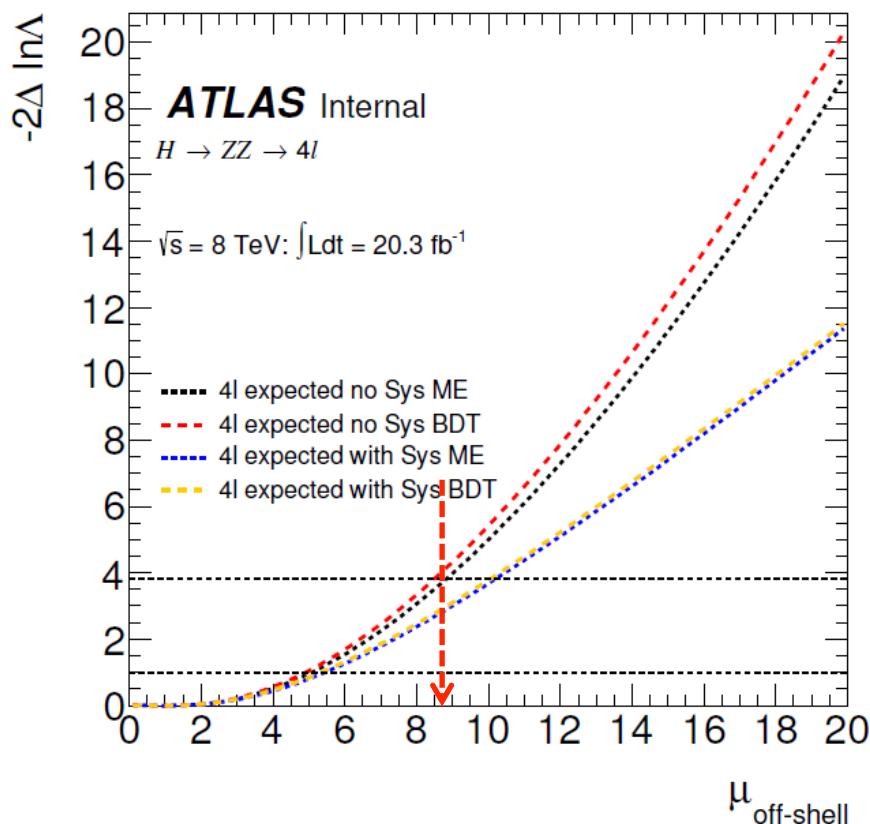

assumption  $\kappa_{i,\text{on-shell}} = \kappa_{i,\text{off-shell}}$

The combination of both on-shell and off-shell measurements of signal strength achieve a significantly higher sensitivity to the total width  $\Gamma_H$ .

# ME and BDT Outputs

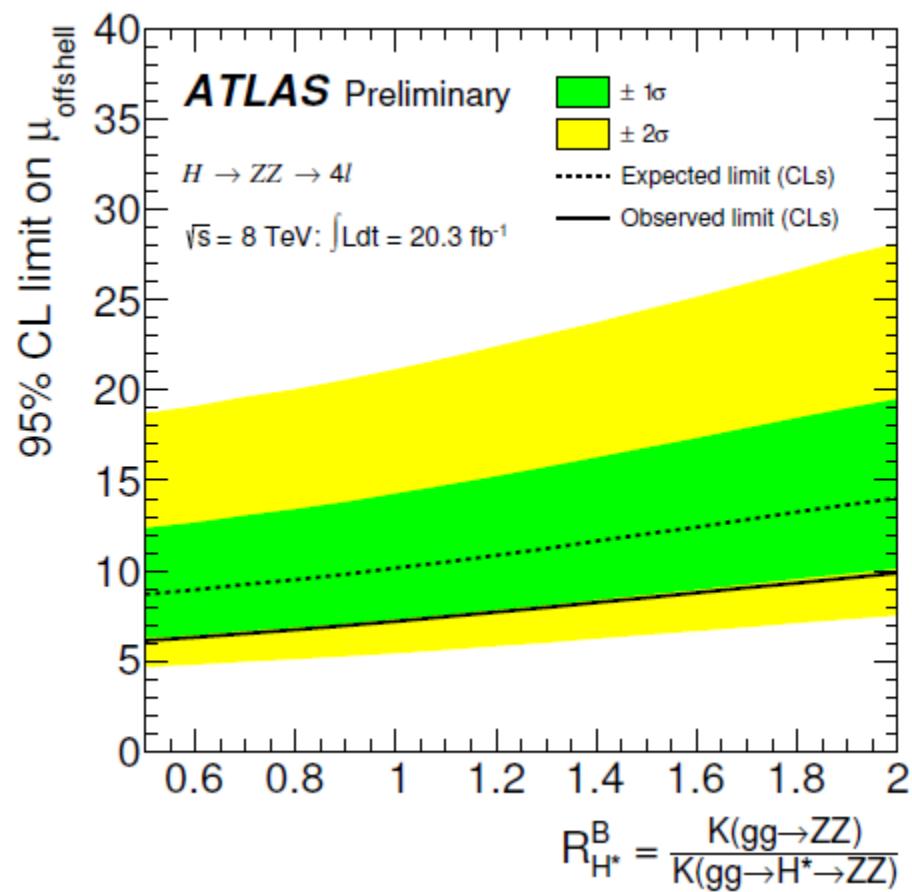

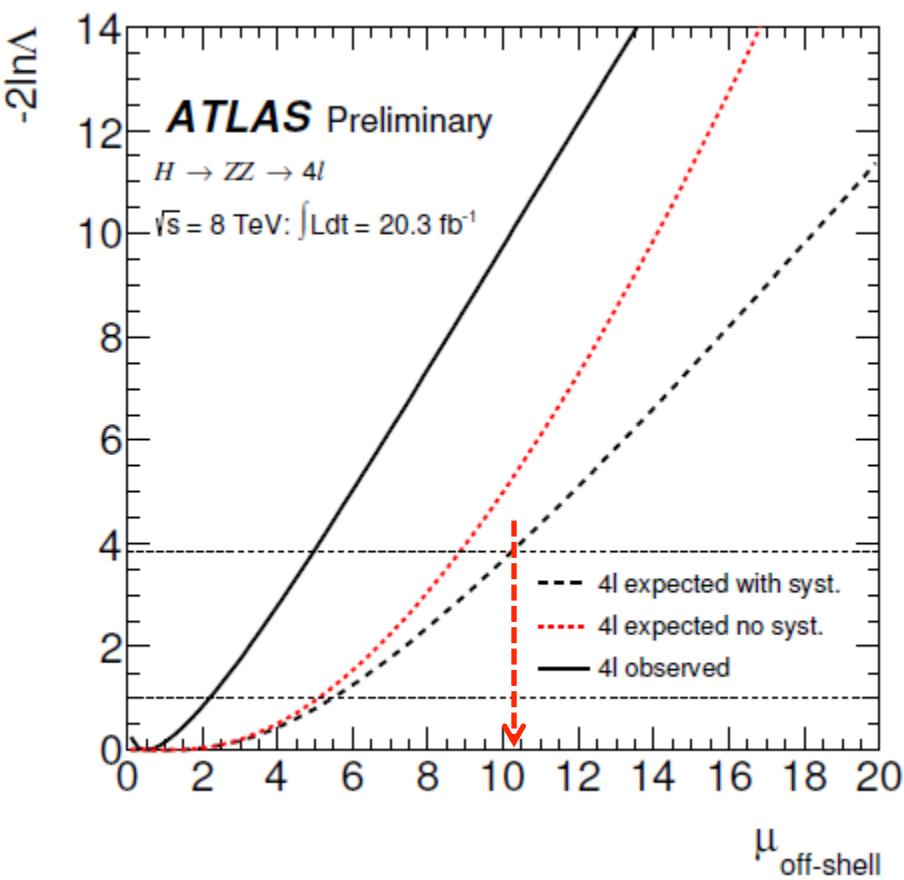

- The expected 95% C.L. upper limits on  $\mu_{\text{off-shell}}$

	Without systematics	With systematics
ME	1.00 (8.85)	1.00 (10.23)
BDT	1.00 (8.52)	1.00 (10.08)

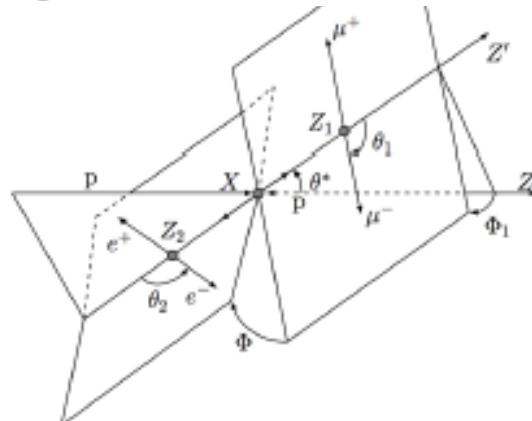

# Indirect Measurement of Higgs Width

- The expected 95% C.L. upper limits on  $\mu_{\text{off-shell}}$ , is 10.1 and the observed limit is 5.

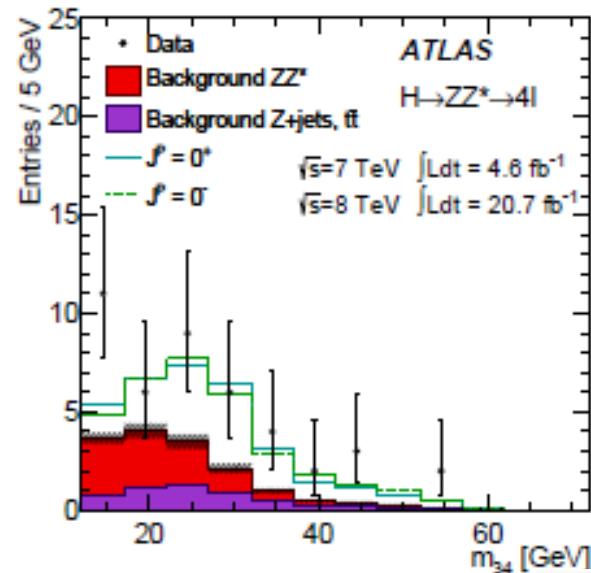

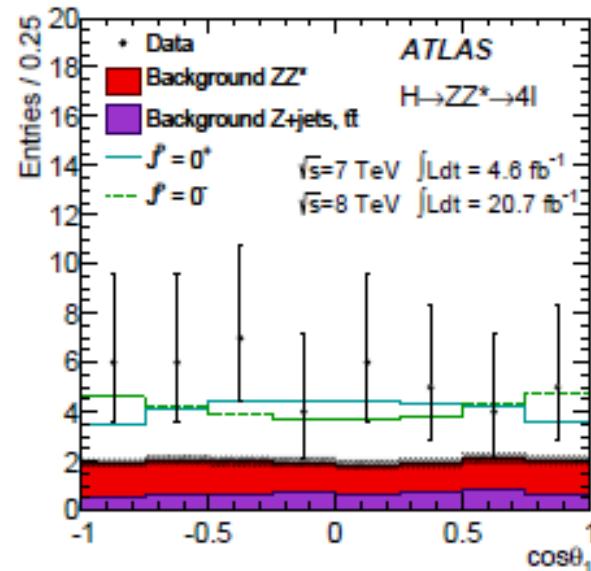

# $H \rightarrow ZZ^* \rightarrow 4l$ : Spin and Parity

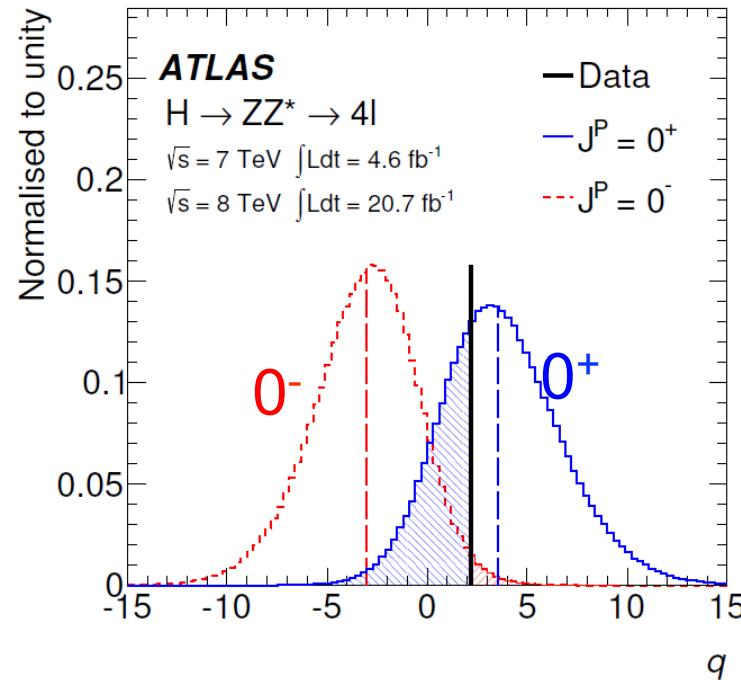

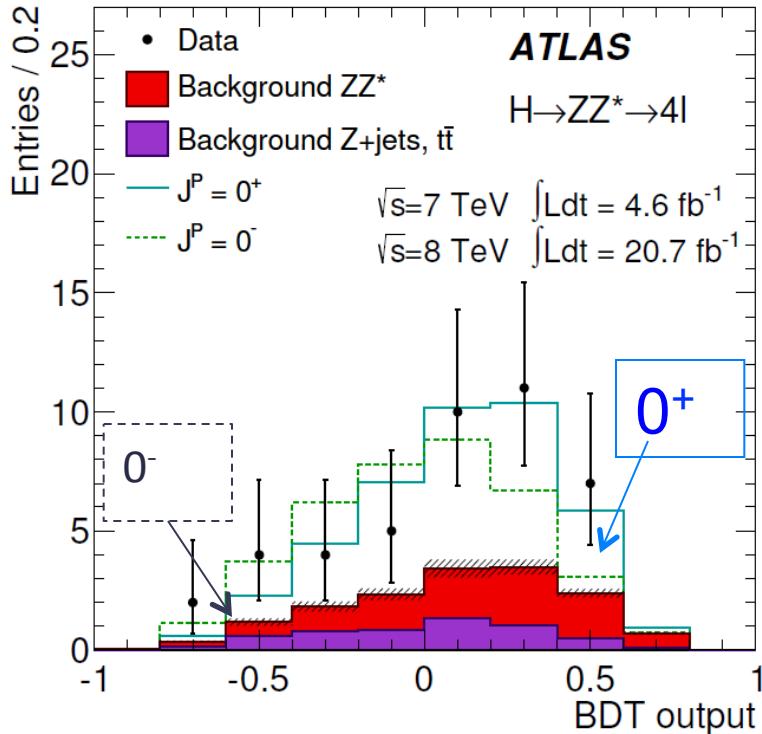

- In  $X \rightarrow ZZ^{(*)} \rightarrow 4\ell$  decays,  $m_{Z_1}$ ,  $m_{Z_2}$  and the production and decay angles are sensitive to the spin-parity of  $X$
- $\{m_{4\ell}, m_{Z_1}, m_{Z_2}, \cos\theta_1, \cos\theta_2, \phi, \cos\theta^*, \phi_1\}$

- Construct a discriminant between different hypotheses using two different multivariate techniques:
  - BDT (machine learning)
  - $J^P$ -MELA (use theoretical differential decay rates to construct a matrix element based likelihood ratio)
- Use events in range  $115 < m_{4\ell} < 130$  GeV
- Test SM  $0^+$  hypothesis against alternative hypotheses  $0^-, 1^+, 1^-, 2_m^+$

# $H \rightarrow ZZ^* \rightarrow 4l$ : Spin and Parity

**BDT analysis variables:**  
 $m_{Z_1}, m_{Z_2}$  from  $H \rightarrow ZZ^* \rightarrow 4l$   
+ production and decay angles

**Exclusion (1-CL<sub>s</sub>):**

**Observed 0<sup>-</sup> exclusion 97.8%**

**Observed 1<sup>+</sup> exclusion 99.8%**

1 observed candidate

87%

## Gluon Gluon Fusion (ggF)

0.5%

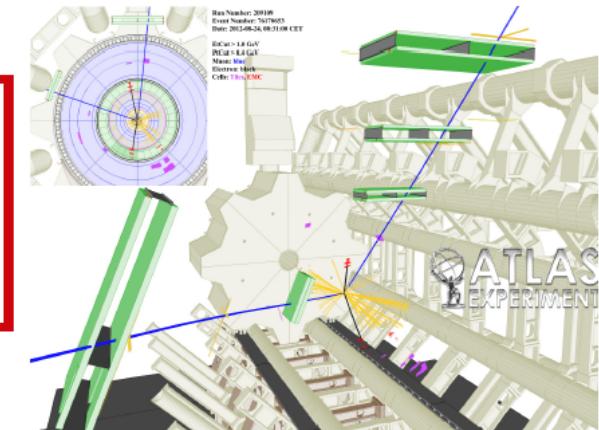

## tt Fusion (ttH)

One VBF candidate with  
 $m_{4\ell} = 123.5$  GeV

In 120-130 GeV:  
Expected  $N_{\text{signal}} = 0.71 \pm 0.10$   
Expected  $N_{\text{VBF}} \sim 0.4$   
Expected S/B  $\sim 5$

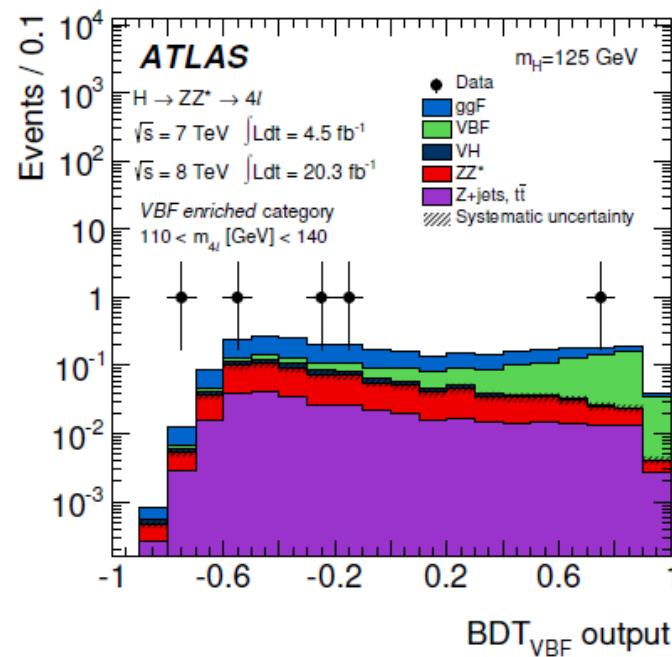

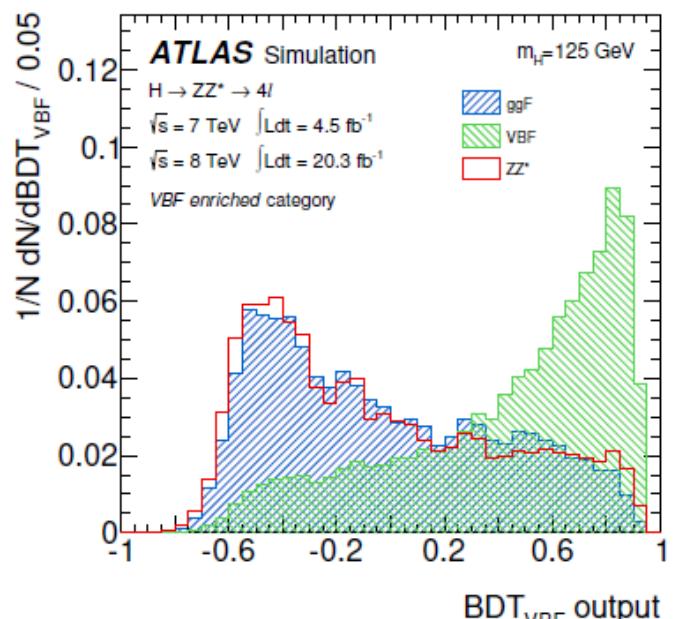

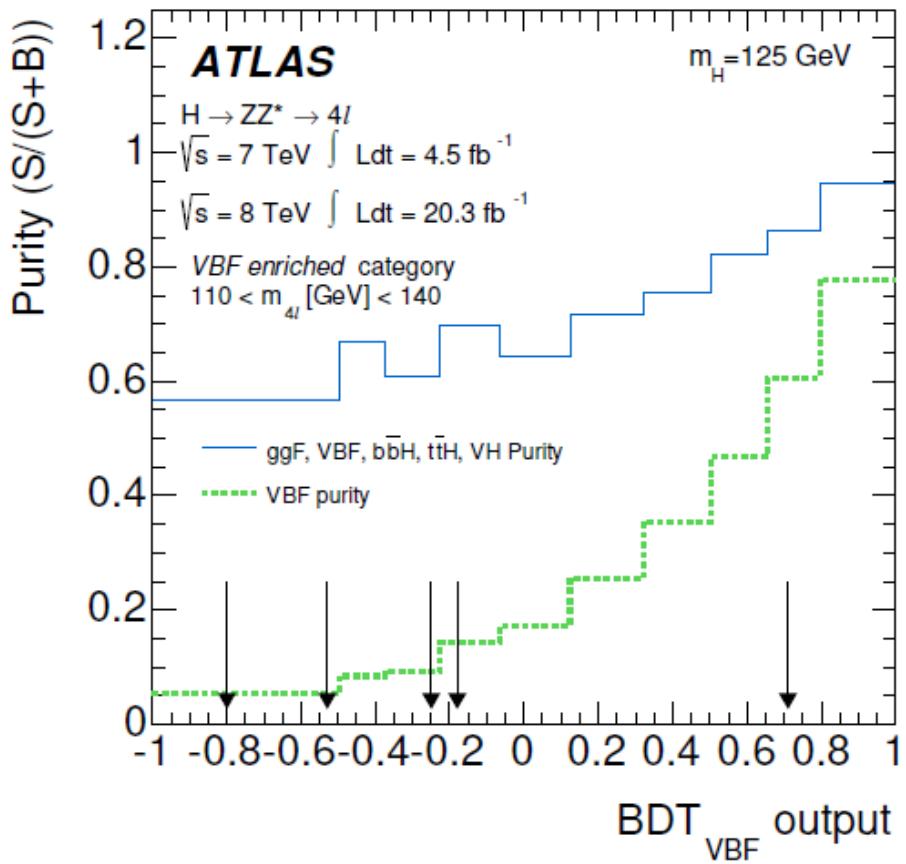

Consistent with  
expected background

Candidate event with  $m_{4\ell} = 123.5$  GeV in  
VBF-like category

# Probing Higgs Production (VBF)

- BDT<sub>VBF</sub> based on 5 variables:
  - $M_{jj}$ ,  $\eta_{jj}$ ,  $\eta_{\text{leading jet}}$
  - $p_T$  of leading and subleading jets

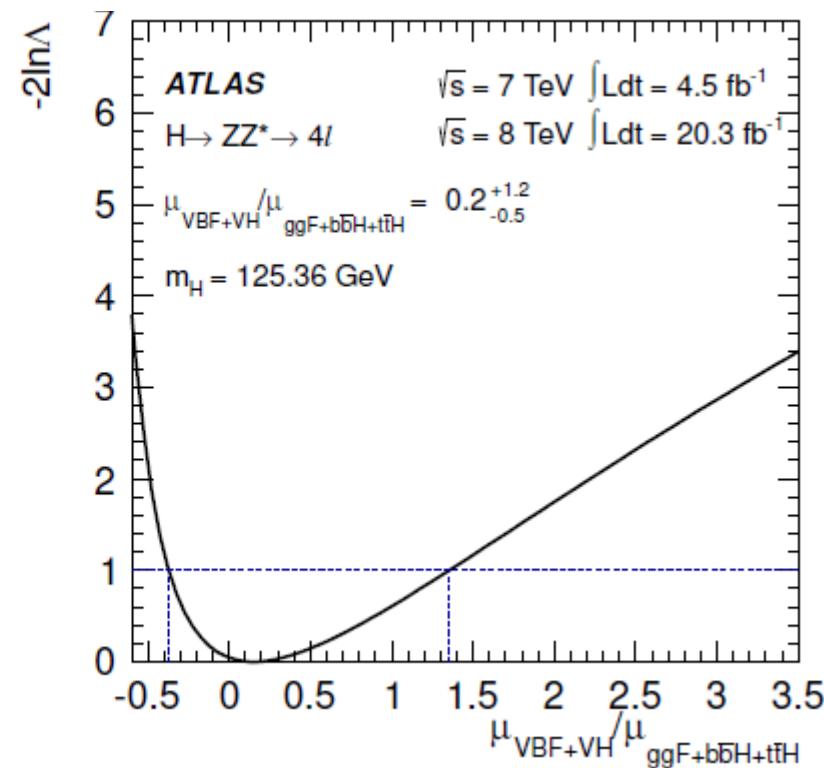

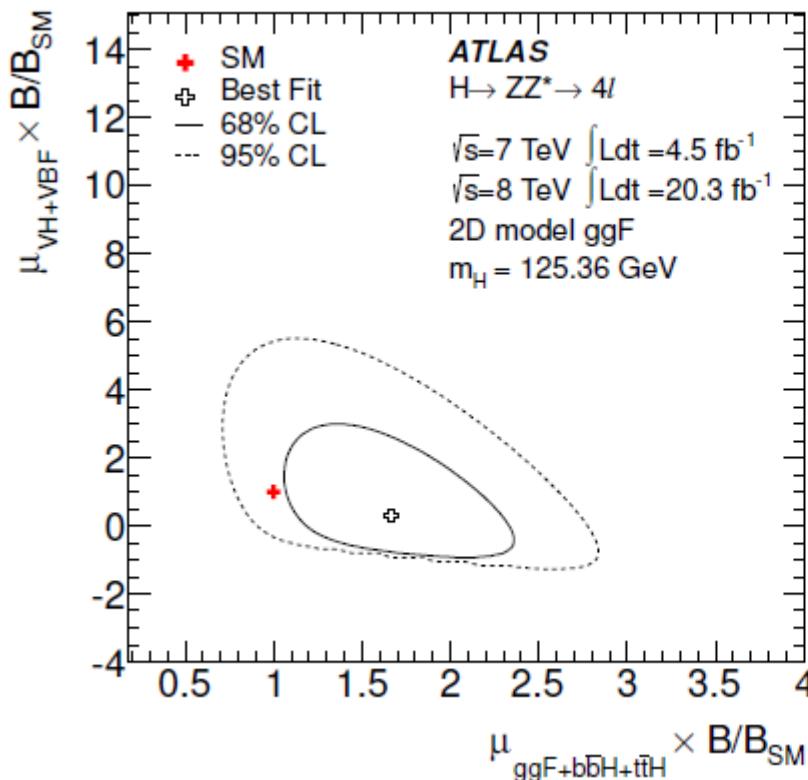

# Probing Higgs Production (VBF)

- The compatibility of VBF production with the SM expectation is 30%.

$$\mu_{\text{VBF+VH}} / \mu_{\text{ggF+b}\bar{b}\text{H+t}\bar{t}\text{H}} = 0.2^{+1.2}_{-0.5}$$

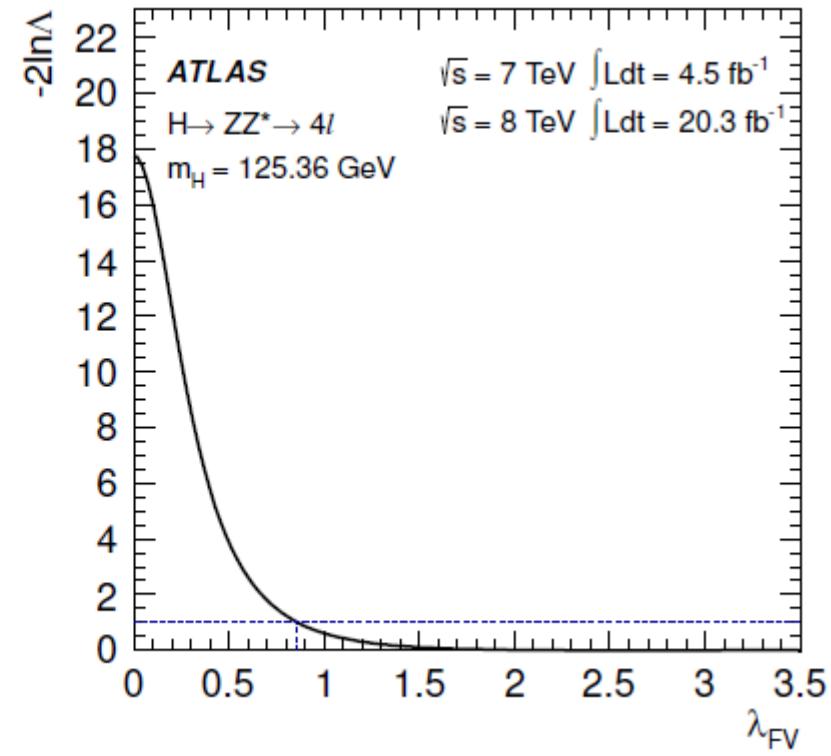

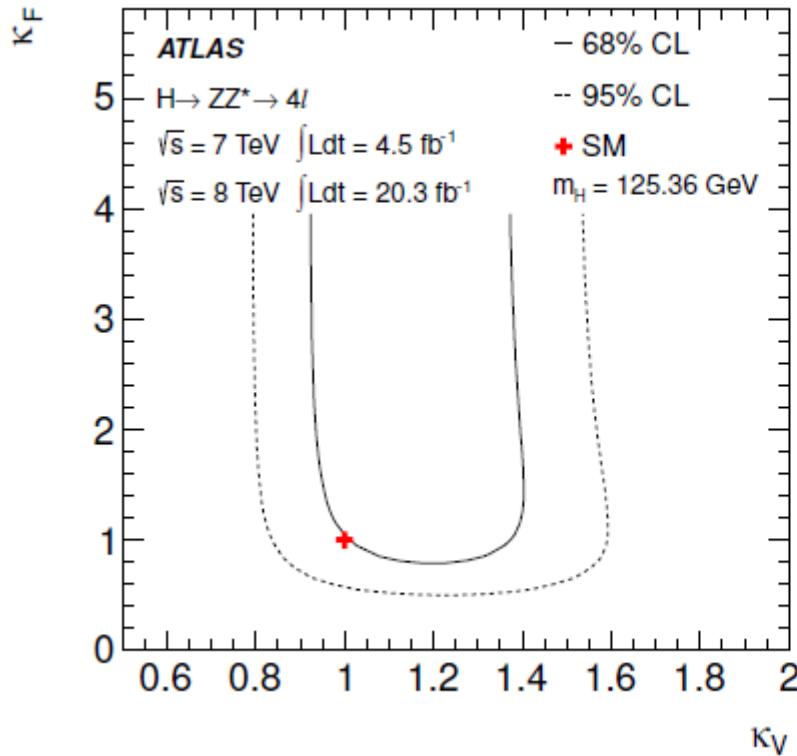

$$\mu_{\text{ggF+b}\bar{b}\text{H+t}\bar{t}\text{H}} \times B/B_{\text{SM}} = 1.66^{+0.45}_{-0.41} \text{ (stat)}^{+0.25}_{-0.15} \text{ (syst)}$$

$$\mu_{\text{VBF+VH}} \times B/B_{\text{SM}} = 0.26^{+1.60}_{-0.91} \text{ (stat)}^{+0.36}_{-0.23} \text{ (syst)}$$

# Fermion and Vector Couplings

- The likelihood scan as a function of the ratio of fermion to vector-boson coupling scale factors,  $\lambda_{\text{FV}} = \kappa_{\text{F}} / \kappa_{\text{V}}$

- The value of  $\lambda_{\text{FV}} = 0$  is disfavored at the  $4\sigma$  level.

# Fermion and Vector Couplings

## Coupling scale factors

2-parameter benchmark model:

$$\kappa_V = \kappa_W = \kappa_Z$$

$$\kappa_F = \kappa_t = \kappa_b = \kappa_c = \kappa_\tau = \kappa_g$$

(Gluon coupling are related to top, b, and their interference in tree level loop diagrams)

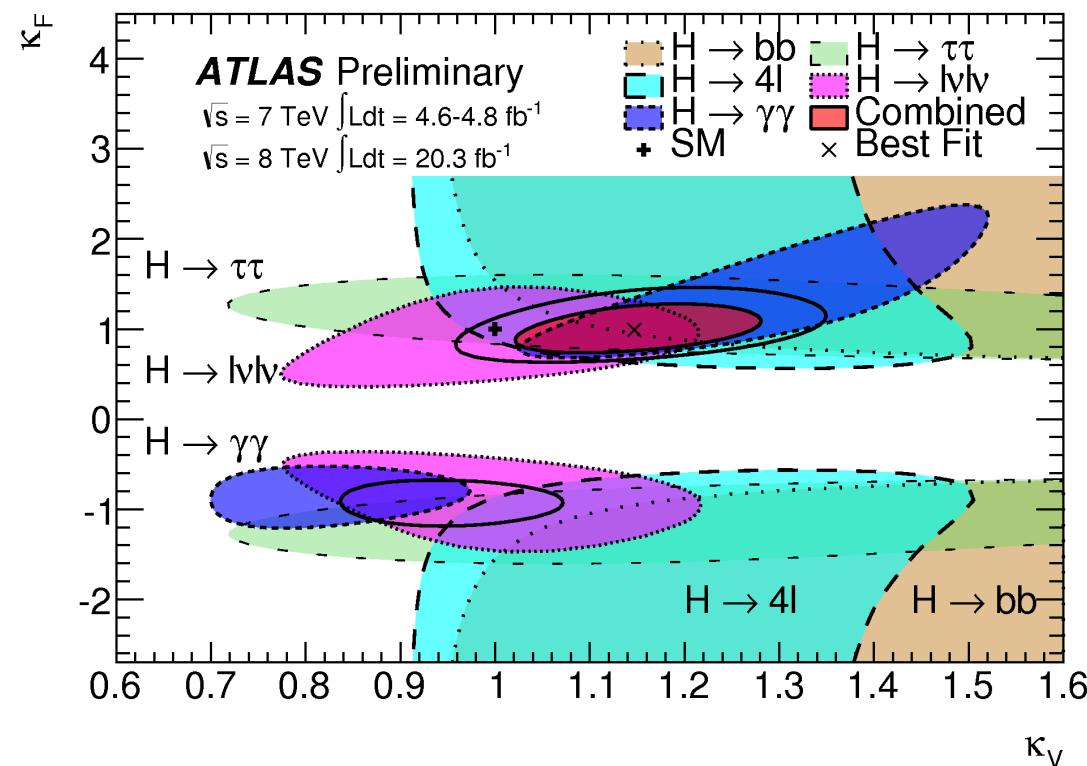

Assume no BSM contributions to loops:  $gg \rightarrow H$  and no BSM decays (no invisible decays)

$$\kappa_V = 1.15 \pm 0.08$$

$$\kappa_F = 0.99^{+0.17}_{-0.15}$$

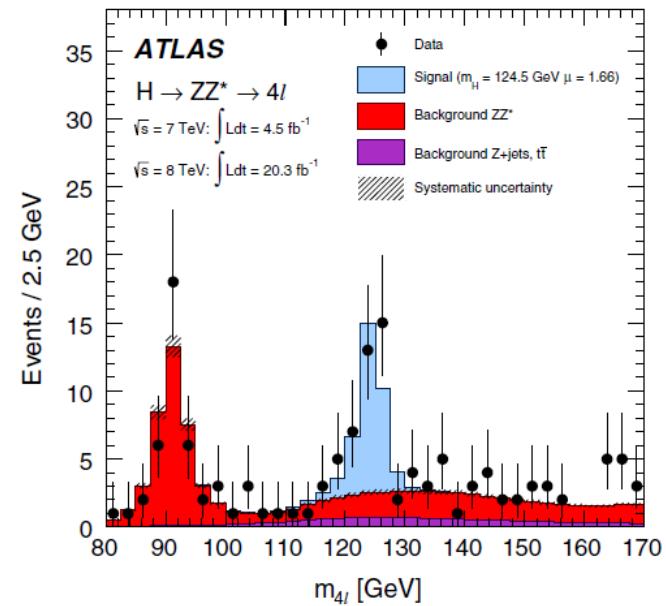

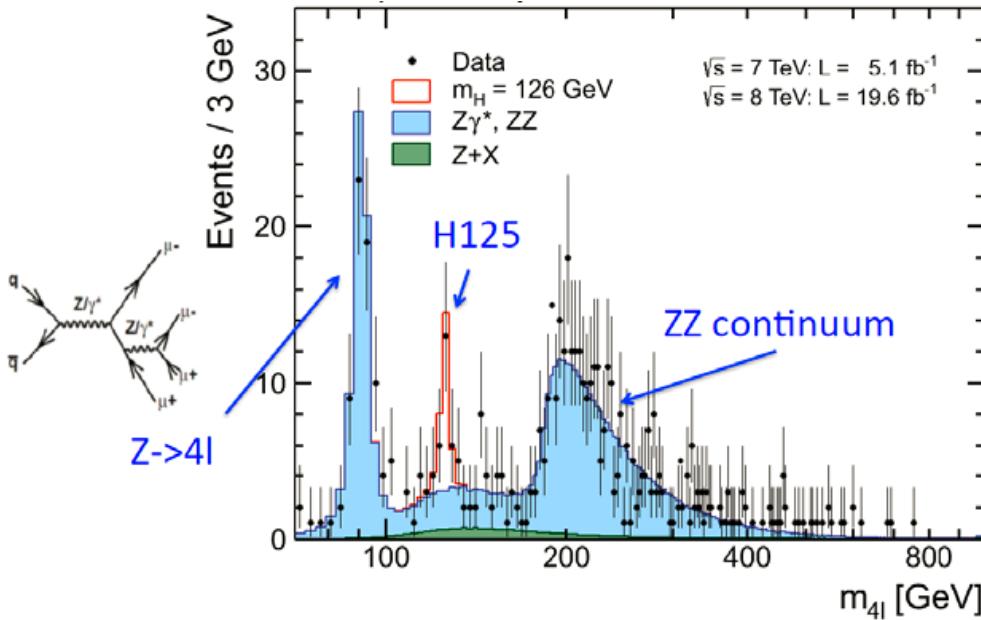

→  $\kappa_F = 0$  is excluded ( $>5\sigma$ )

$$\frac{\sigma \cdot B (gg \rightarrow H \rightarrow \gamma\gamma)}{\sigma_{\text{SM}}(gg \rightarrow H) \cdot B_{\text{SM}}(H \rightarrow \gamma\gamma)} = \frac{\kappa_g^2 \cdot \kappa_\gamma^2}{\kappa_H^2}$$

# Analysis of Single Resonance $Z \rightarrow 4\ell$

- The  $Z \rightarrow 4\ell$  production was first observed at the LHC by ATLAS and CMS along with the Higgs boson discovery in  $4\ell$  decay channel
- Cross section measurement of the  $Z \rightarrow 4\ell$  production provides
  - A SM test for a rare decay process, meas. of  $\sigma(4\ell)$  and  $\text{BR}(Z \rightarrow 4\ell)$
  - A complementary test of the detector response for  $H \rightarrow 4\ell$  detection

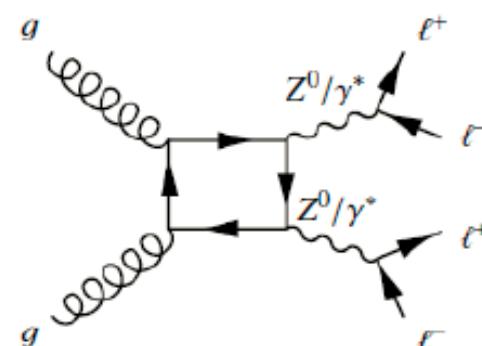

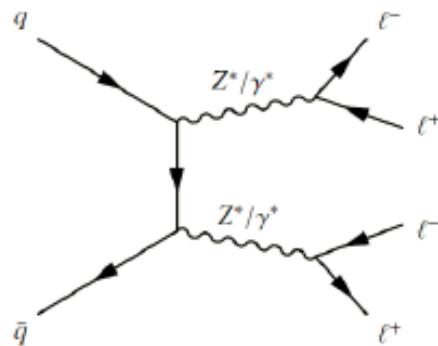

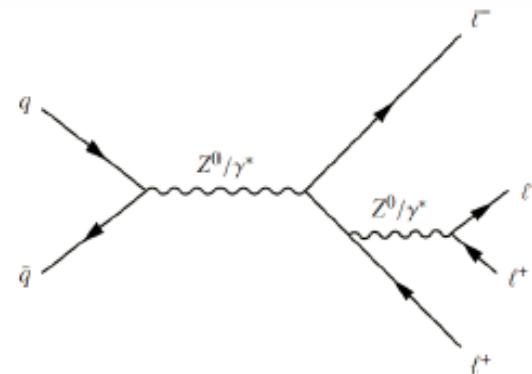

ATLAS: Phys. Rev. Lett. 112, 231806 (2014) arXiv:1403.5657

CMS: JHEP 12 (2012) 034, arXiv:1210.3844

# Production of single resonance $Z \rightarrow 4l$

- ❖ Four lepton 4l final states: 4e, 4m and 2e2m
- ❖ **Resonant 4l production** via an s-channel  $Z \rightarrow \ell^+ \ell^-$  include an additional  $\ell^+ \ell^-$  from internal conversion of  $Z^*/\gamma^*$
- ❖ > 96% 4l event rate from s-channel at Z resonance ( $80 < m_{4l} < 100$  GeV,  $m_{2l} > 5$  GeV)
- ❖ **Non-resonant 4l production**
  - via t-channel:  $q\bar{q} \rightarrow Z^*/\gamma^* + Z^*/\gamma^* \rightarrow 4l$  including the Z production with ISR internal conversion (< 4% 4l event rate at the Z resonance)
  - via gg  $\rightarrow ZZ \rightarrow 4l$  (~0.1% 4l event rate at the Z resonance)

# Cuts Optimization

ATLAS Higgs  $\rightarrow ZZ^* \rightarrow 4l$  selection:

- $pT_{min} > 7$  (6) GeV for e ( $\mu$ )
- $m_{12} > 50$  GeV;  $m_{34} > 12$  GeV

Select 37  $Z \rightarrow 4l$  events in  $Z$  mass window

- The  $Z \rightarrow 4l$  process is dominant by low mass  $m_{34}$  and low  $pT$  leptons (the  $pT$ -ordered 4<sup>th</sup> leptons)
- Need to detect low  $pT$  leptons

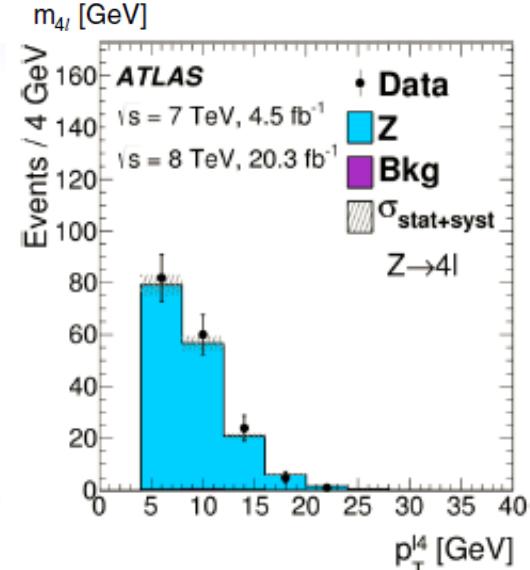

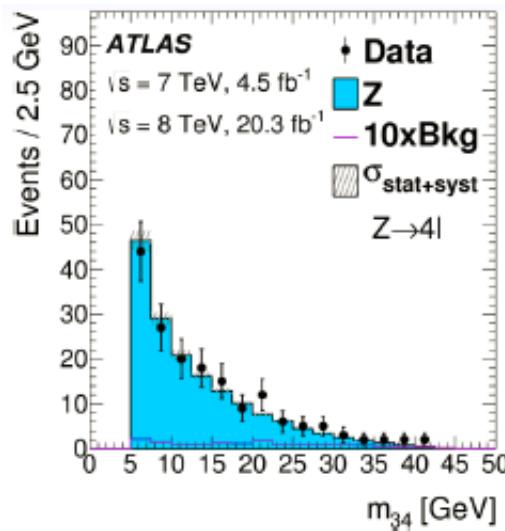

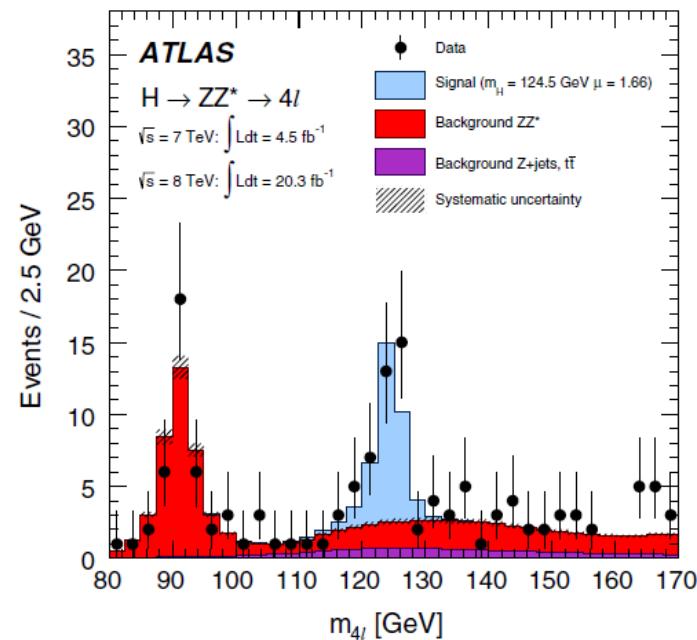

Loosen some Higgs cuts :

e :  $p_T > 20, 15, 10, 7$  GeV

$\mu$  :  $p_T > 20, 15, 8, 4$  GeV

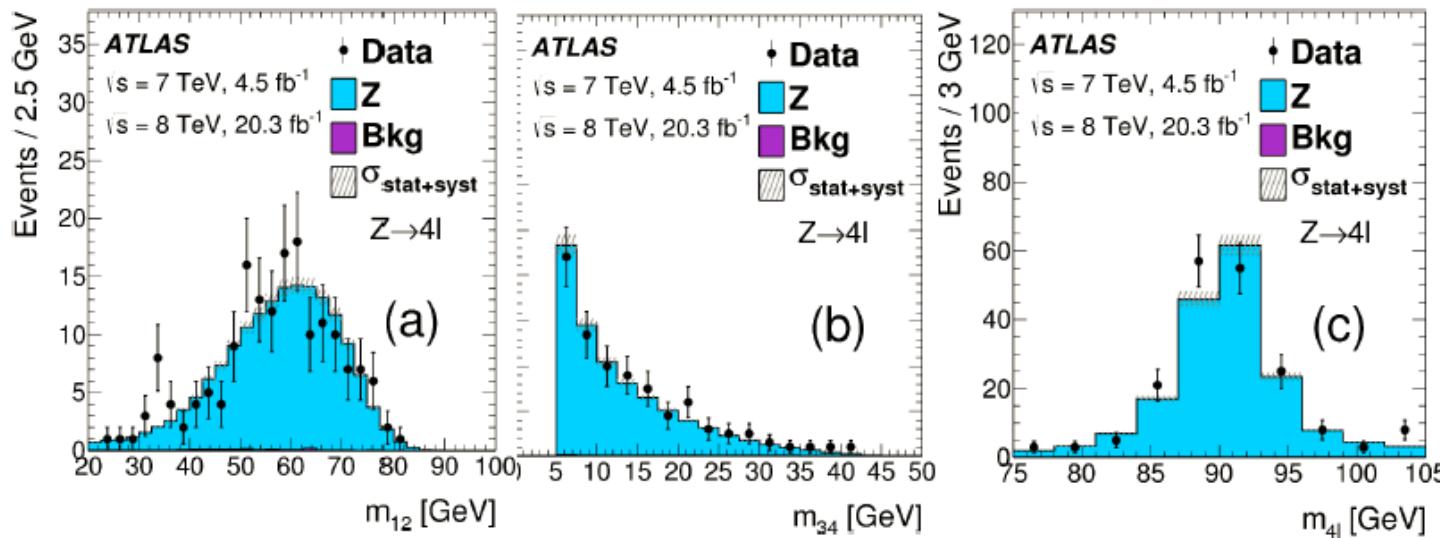

$m_{12} > 20$  GeV,  $m_{34} > 5$  GeV

Increase statistics by a factor of 5

# ATLAS: BR of Z $\rightarrow$ 4l

- Measure the Z $\rightarrow$ 2 $\mu$  cross section and take the known Br(Z $\rightarrow$ 2m) to get inclusive cross section of Z from pp collisions
- Cancels luminosity uncertainty and theoretical uncertainty of  $\sigma(pp \rightarrow Z)$
- Derive the BR (Z $\rightarrow$ 4l) as below

$$\text{BR}(Z \rightarrow 4\ell) = \text{BR}(Z \rightarrow 2\mu)(1 - f_t) \frac{(N_{\text{obs.}} - N_{\text{bkg.}})^{4\ell} (C \times A)^{2\mu}}{(N_{\text{obs.}} - N_{\text{bkg.}})^{2\mu} (C \times A)^{4\ell}}$$

Uncertainty on  $\text{BR}(Z \rightarrow 2\mu)$  is small.  $f_t$  = fraction of t-channel in phase-space.

- Cancel luminosity uncertainty: 2.8% (8 TeV)
- Cancel NLO  $\sigma(Z)$  calculation uncertainties (Scales, PDF, NNLO correction): 4%

# Branching Ratio of Z $\rightarrow$ 4l

Branching fraction result uses an error weighted combination of the 7 and 8 TeV results. For ( $m_{2l} > 5 \text{ GeV}$ ,  $80 < m_{4l} < 100 \text{ GeV}$ )

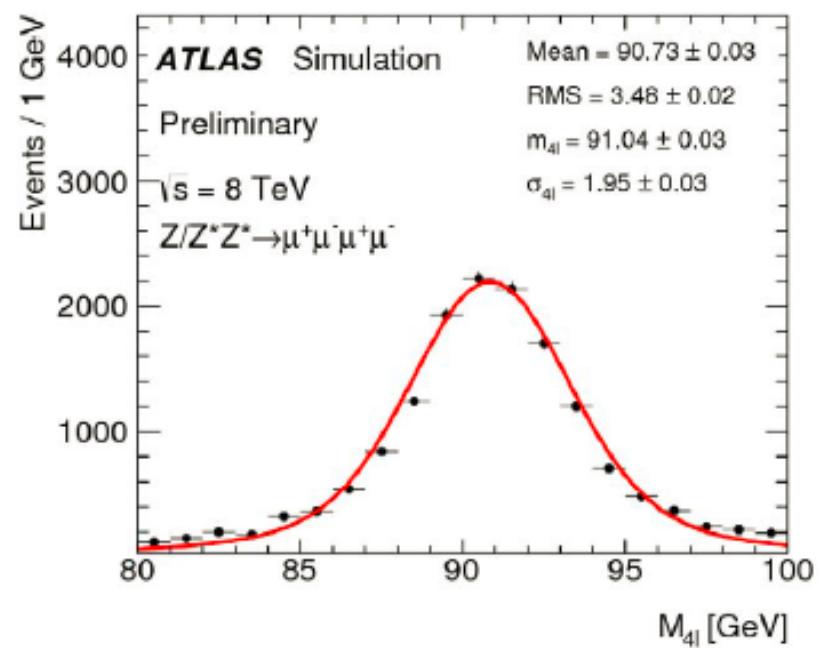

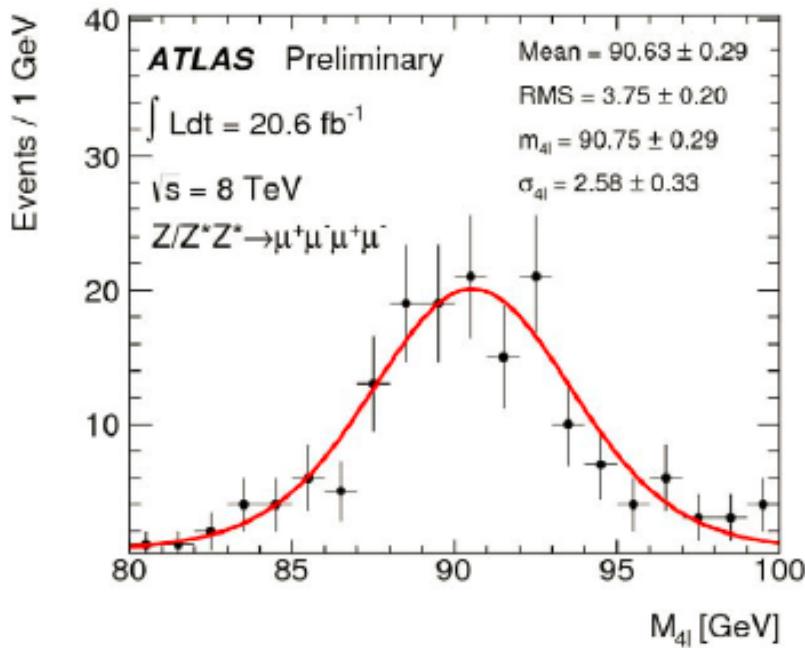

Quantity	$\sqrt{s}$	Value	ATLAS
Measured	7 TeV	$(2.67 \pm 0.62 \text{ (stat)} \pm 0.14 \text{ (syst)}) \times 10^{-6}$	
	8 TeV	$(3.33 \pm 0.27 \text{ (stat)} \pm 0.11 \text{ (syst)}) \times 10^{-6}$	
	Combined	$(3.20 \pm 0.25 \text{ (stat)} \pm 0.13 \text{ (syst)}) \times 10^{-6}$	
Expected		$(3.33 \pm 0.01) \times 10^{-6}$	

For  $M_{\ell\ell} > 4 \text{ GeV}$

- We observe  $(4.31 \pm 0.34 \text{ (stat)} \pm 0.16 \text{ (syst)}) \times 10^{-6}$  and expect  $(4.50 \pm 0.01) \times 10^{-6}$ , (ATLAS combining 7 & 8 TeV measurements)
- CMS observes  $(4.2^{+0.9}_{-0.8} \text{ (stat)} \pm 0.2 \text{ (syst)}) \times 10^{-6}$  and expects  $4.45 \times 10^{-6}$ .

# ATLAS: 4-lepton Mass Scale

- 4-lepton mass fitted with the convolution of a Breit-Wigner and a Gaussian distributions for 4 channels
- Fitted results show good consistency with MC predictions
- Example of  $4\mu$  mass fit for data and MC

# Summary

- With 2011 ( $4.5 \text{ fb}^{-1}$  @ 7TeV) and 2012 ( $20.3 \text{ fb}^{-1}$  @ 8 TeV) datasets, the Higgs boson is observed in the  $H \rightarrow ZZ^* \rightarrow 4\ell$  channel with local significance of  $8.1\sigma$ .
- The best fit mass of the Higgs boson from  $H \rightarrow ZZ^* \rightarrow 4\ell$

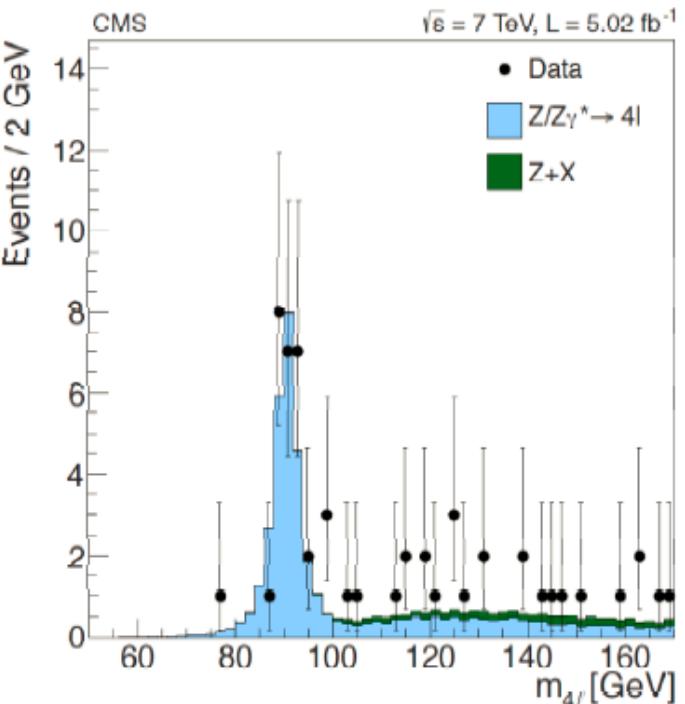

Channel	Mass measurement [GeV]
$H \rightarrow \gamma\gamma$	$125.98 \pm 0.42(\text{stat}) \pm 0.28(\text{syst}) = 125.98 \pm 0.50$
$H \rightarrow ZZ^* \rightarrow 4\ell$	$124.51 \pm 0.52(\text{stat}) \pm 0.06(\text{syst}) = 124.51 \pm 0.52$
Combined	$125.36 \pm 0.37(\text{stat}) \pm 0.18(\text{syst}) = 125.36 \pm 0.41$

- The ratio of signal strength for bosonic (VBF+VH) and fermionic (ggF+ttH) production modes are measured, the compatibility of VBF production with SM expectation is 30%.
- The SM Higgs boson with  $J^P = 0^+$  hypothesis is favored.
- The Higgs mass width  $\Gamma_H < 2.6 \text{ GeV} / 42 \text{ MeV}$  @ 95% C.L. for direct / indirect measurements.
- BR of  $Z \rightarrow 4\ell$  is  $4.3 \times 10^{-6}$  which agree with SM prediction.

# Higgs Width (CMS)

□ <https://cds.cern.ch/record/1670066/files/HIG-14-002-pas.pdf>

The production cross section as a function of  $m_{ZZ}$  can be written as:

$$\frac{d\sigma_{gg \rightarrow H \rightarrow ZZ}}{dm_{ZZ}^2} \propto g_{ggH}^2 g_{HZZ}^2 \frac{F(m_{ZZ})}{(m_{ZZ}^2 - m_H^2)^2 + m_H^2 \Gamma_H^2}, \quad (1)$$

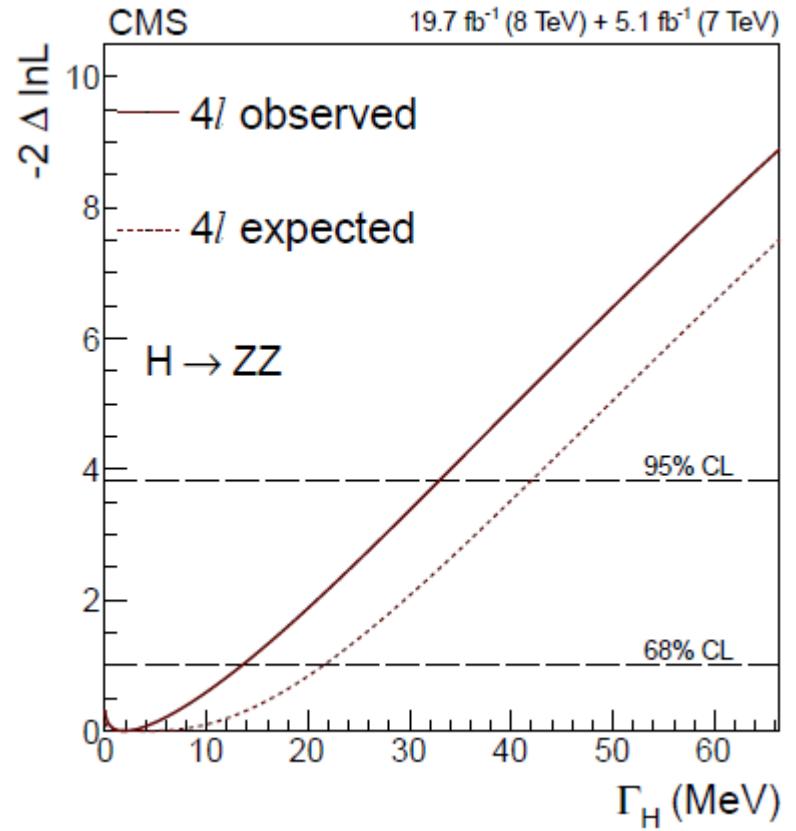

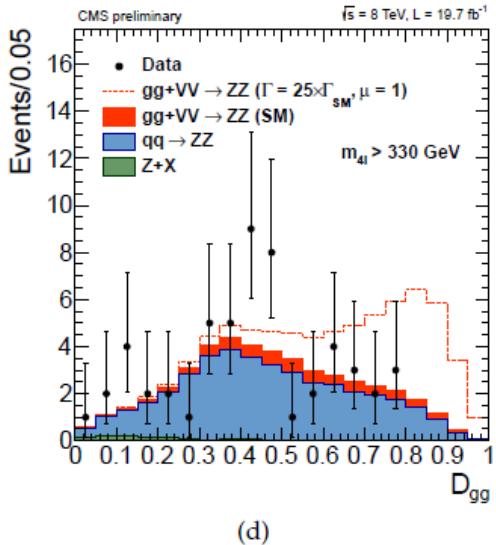

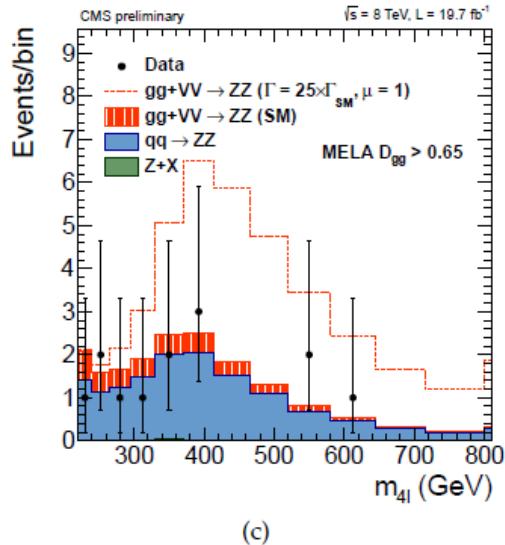

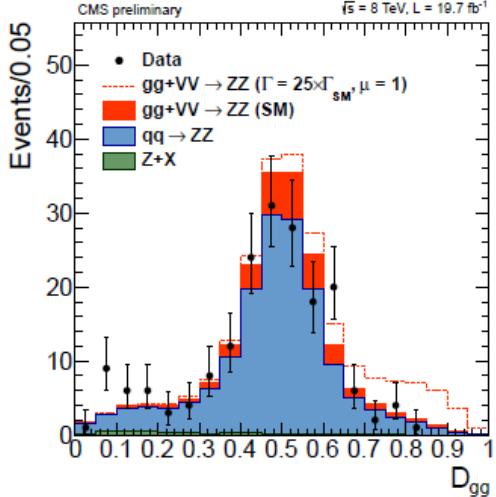

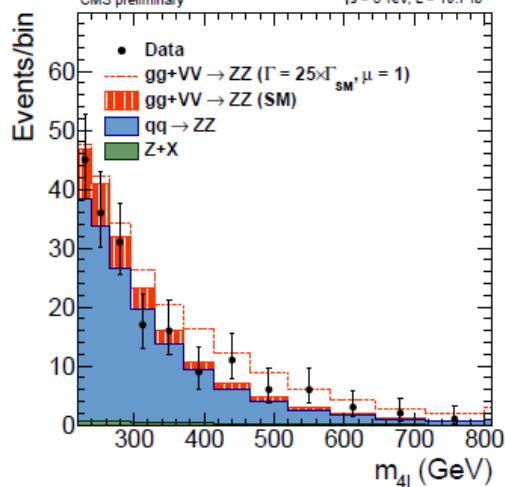

where  $g_{ggH}$  ( $g_{HZZ}$ ) is the coupling constant of the Higgs boson to gluons (to Z bosons), and  $F(m_{ZZ})$  is a function which depends on the (virtual) Higgs and Z boson production and decay dynamics. In the resonant and off-shell regions, the integrated cross sections are

$$\sigma_{gg \rightarrow H \rightarrow ZZ}^{\text{on-peak}} \propto \frac{g_{ggH}^2 g_{HZZ}^2}{\Gamma_H}, \quad \sigma_{gg \rightarrow H \rightarrow ZZ}^{\text{off-peak}} \propto g_{ggH}^2 g_{HZZ}^2. \quad (2)$$

	$4\ell$	$2\ell 2\nu$	Combined
Expected 95% CL limit, $r$	11.5	10.7	8.5
Observed 95% CL limit, $r$	6.6	6.4	4.2
Observed 95% CL limit, $\Gamma_H$ (MeV)	27.4	26.6	17.4
Observed best fit, $r$	$0.5^{+2.3}_{-0.5}$	$0.2^{+2.2}_{-0.2}$	$0.3^{+1.5}_{-0.3}$
Observed best fit, $\Gamma_H$ (MeV)	$2.0^{+9.6}_{-2.0}$	$0.8^{+9.1}_{-0.8}$	$1.4^{+6.1}_{-1.4}$

# Higgs Width (CMS)

<https://cds.cern.ch/record/1670066/files/HIG-14-002-pas.pdf>

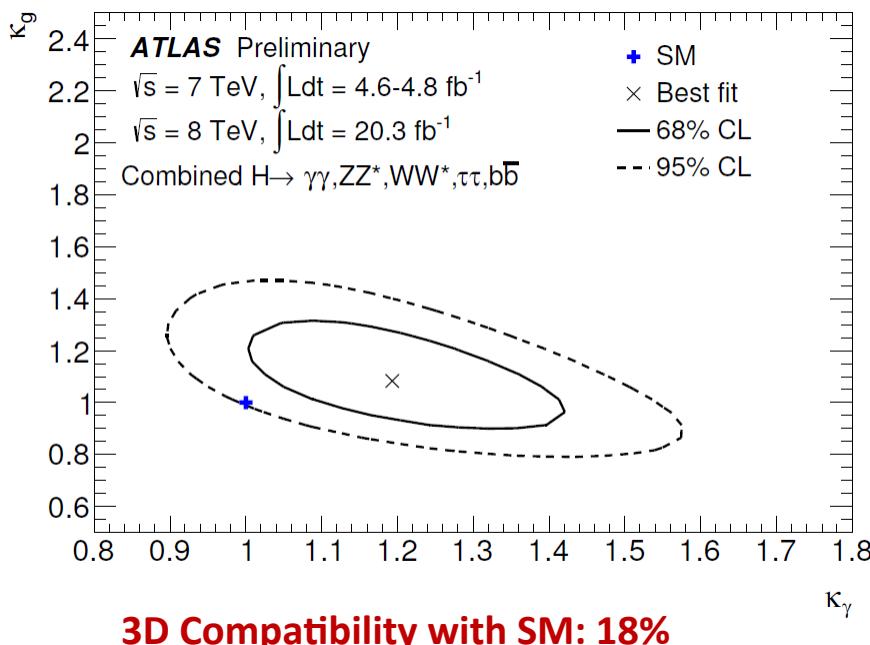

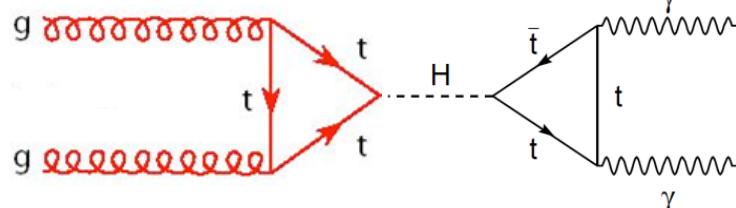

$\Gamma_H < 33 \text{ MeV} (42 \text{ MeV})$  at 95% C.L.

# Constraints on BSM

## New heavy particles may contribute to loops

- Introduce effective  $\kappa_g, \kappa_\gamma$  to allow heavy BSM particles contribute to the loops
- Tree-level couplings:  $\kappa_W, \kappa_Z, \kappa_t, \kappa_b, \kappa_\tau$  etc set to 1
  - Absorb all difference into loop couplings
  - Indirectly fixed normalization of Higgs width

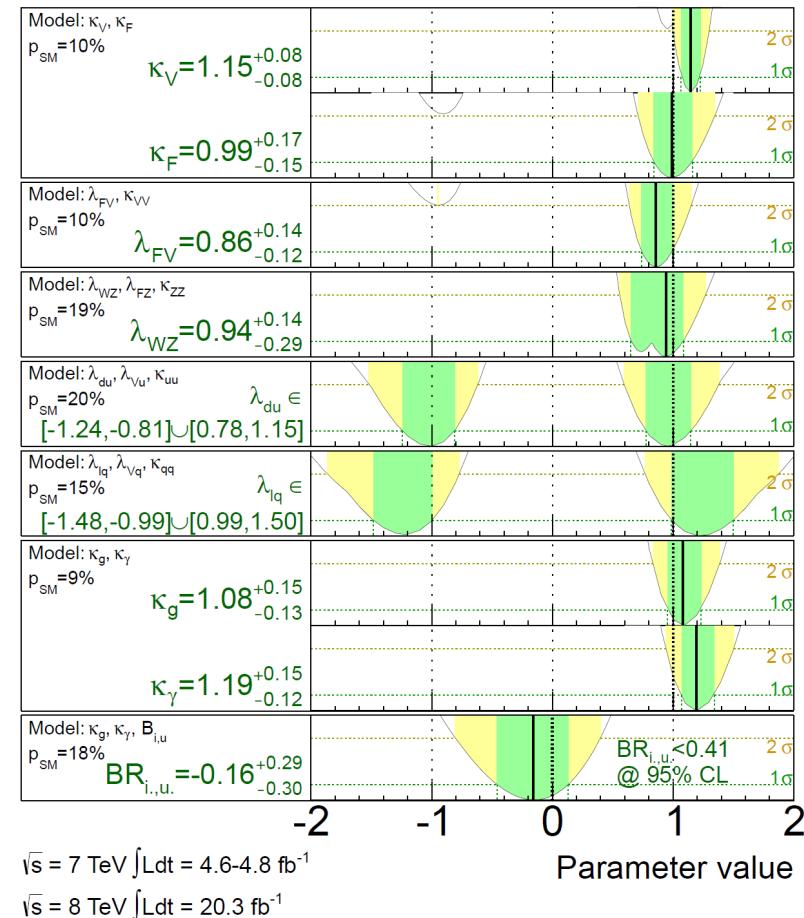

ATLAS Preliminary

$m_H = 125.5 \text{ GeV}$

Total uncertainty

$\pm 1\sigma$

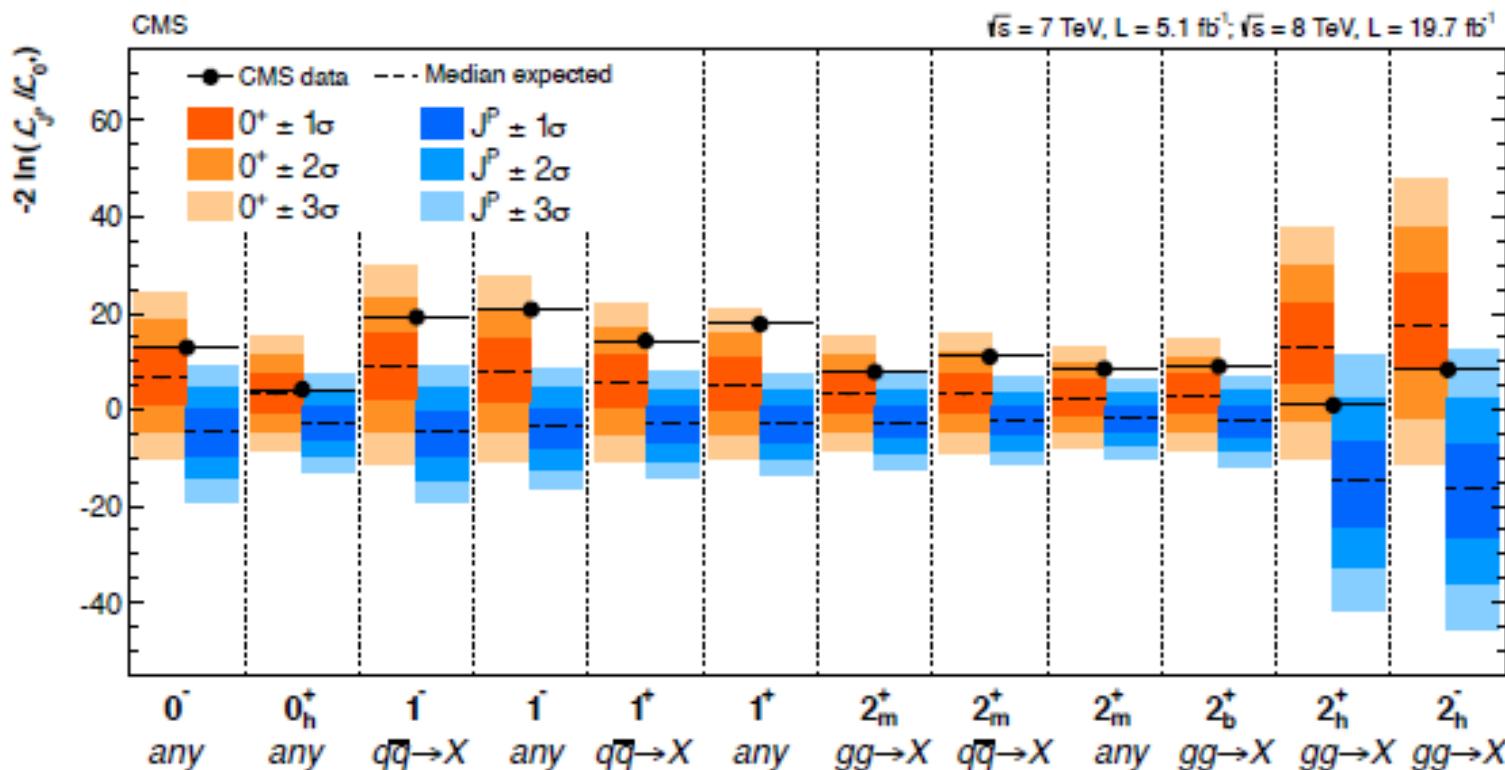

$\pm 2\sigma$

Couplings tested for anomalies w.r.t.  
fermion and boson, W/Z & vertex loop  
contributions at  $\pm 10\%-15\%$  precision

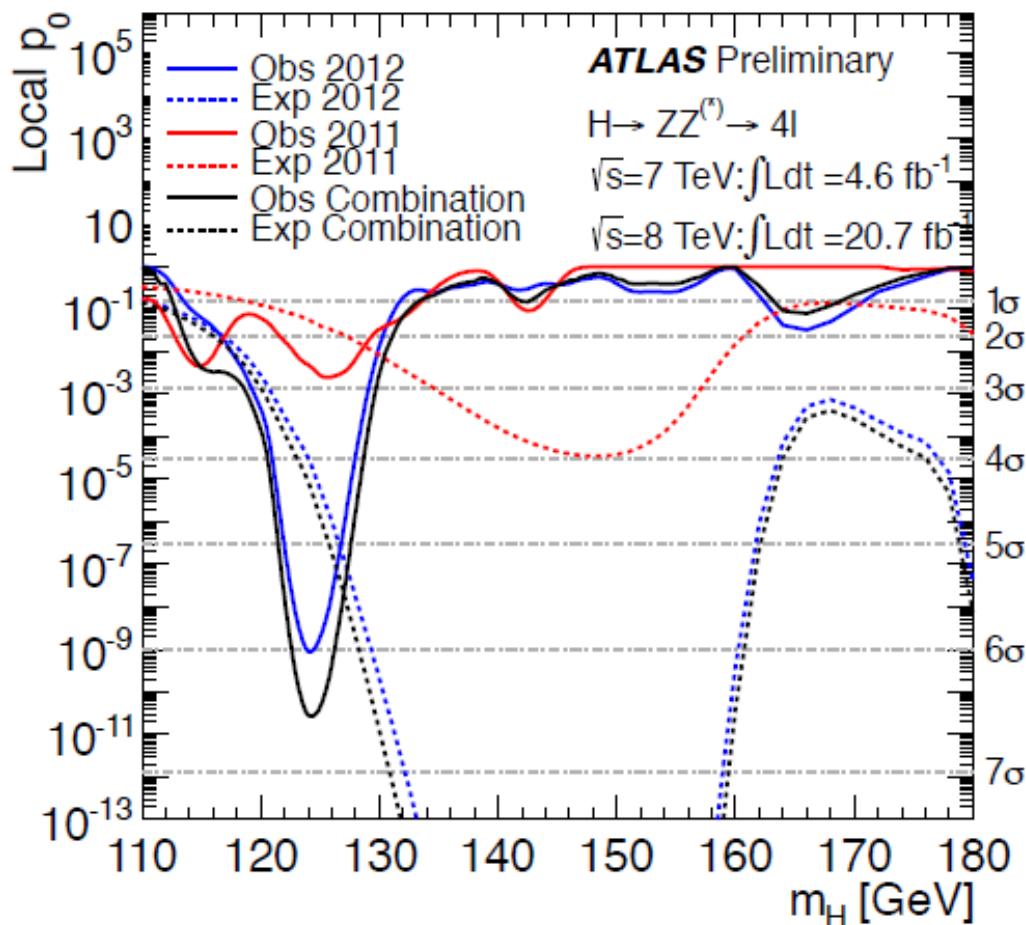

# Higgs Spin and Parity with CMS

- The data disfavor the hypotheses  $JP$  with a  $CL_s$  value in the range of 0.001% - 10%.

# Higgs Detection Significance

data set	observed			expected	
	min $p_0$	significance [ $\sigma$ ]	$m_H(p_0)$	min $p_0(m_H)$	significance [ $\sigma$ ]

$\sqrt{s} = 8 \text{ TeV}$	$8.8 \times 10^{-10}$	6.0	124.1 GeV	$2.8 \times 10^{-5}$	4.0
combined	$2.7 \times 10^{-11}$	6.6	124.3 GeV	$5.7 \times 10^{-6}$	4.4

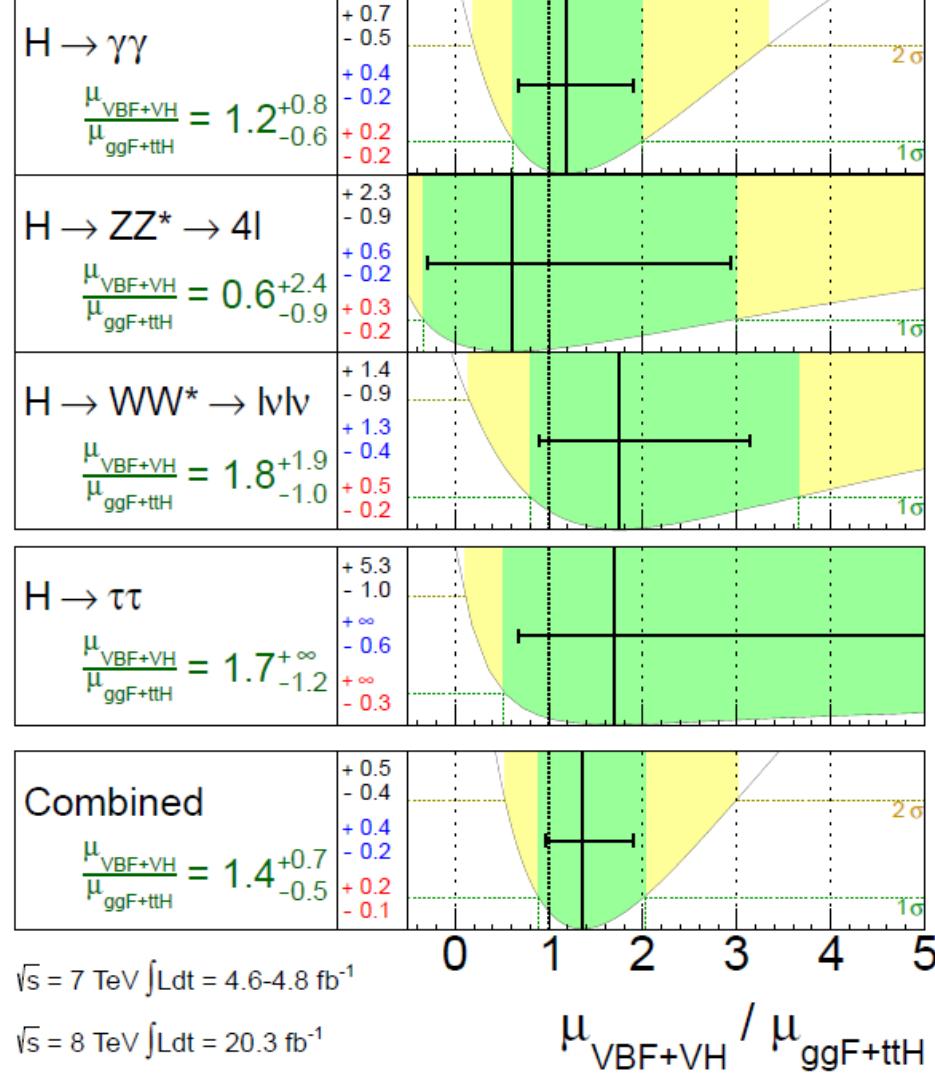

**Signal significance**  
**6.6  $\sigma$  (Measured)**  
**4.4  $\sigma$  (Expected)**

**→ > 5 $\sigma$  discovery in**  
 **$H \rightarrow ZZ^* \rightarrow 4\ell$  channel**

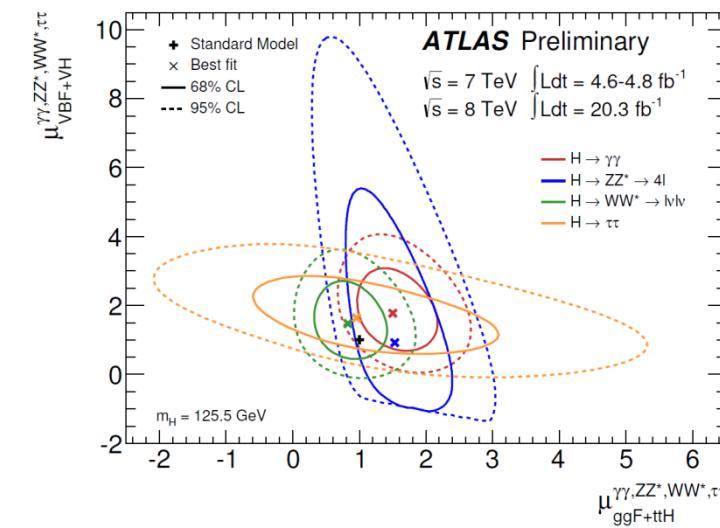

# Higgs Production: ggF vs.VBF

**ATLAS Prelim.**

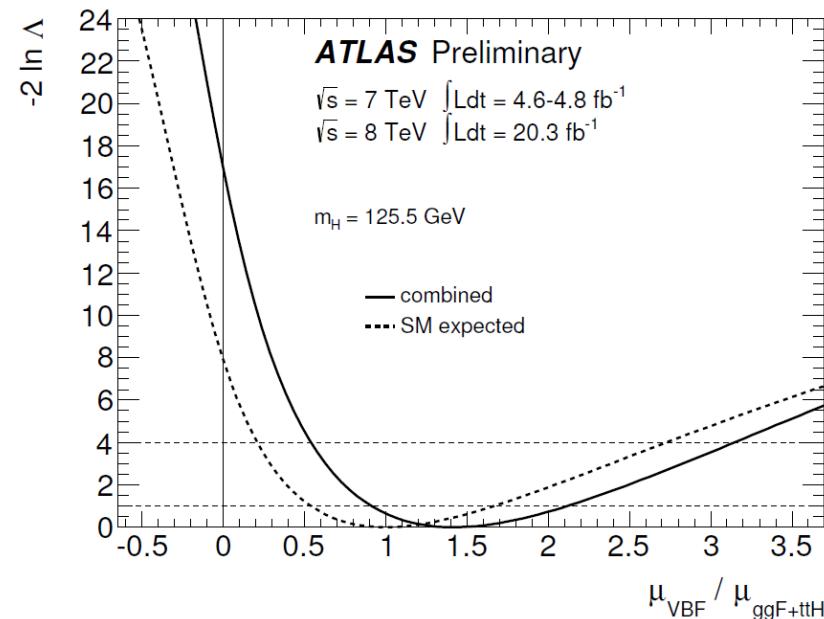

$m_H = 125.5 \text{ GeV}$

$\mu_{\text{VBF+VH}}$  vs  $\mu_{\text{ggF+ttH}}$  potentially modified by  $B/B_{\text{SM}}$

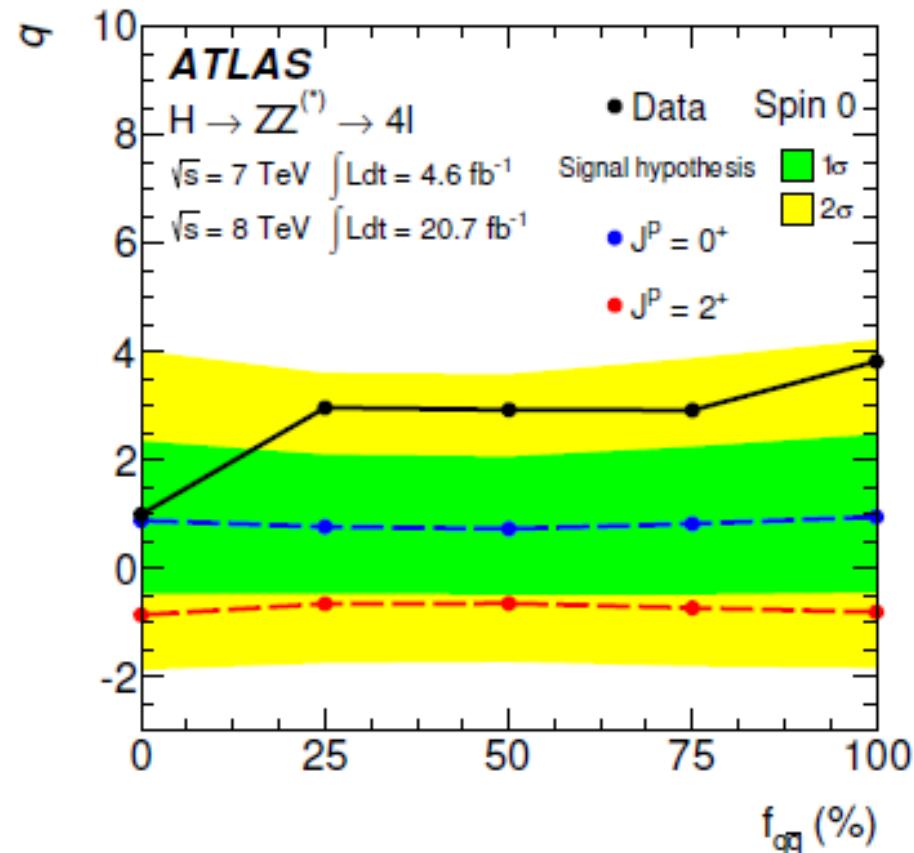

Compatibility with  $\mu_{\text{VBF}}=0 \rightarrow 4.1\sigma$

# $H \rightarrow ZZ^* \rightarrow 4l$ : Spin and CP

- For  $J^P = 2_+^+$  model:
  - Graviton-like tensor with minimal couplings to SM particles
  - See Phys. Rev. D81 (2010) 075022
  - Production via  $gg$  or  $q\bar{q}$
- Scan fraction of  $q\bar{q}$  production between 0 and 100%
- Sensitivity is stable as a function of  $q\bar{q}$  fraction
- Observed exclusion ( $0^+$  vs  $2_+^+$ ) at 83.2 CL for 100%  $ggF$  produced state

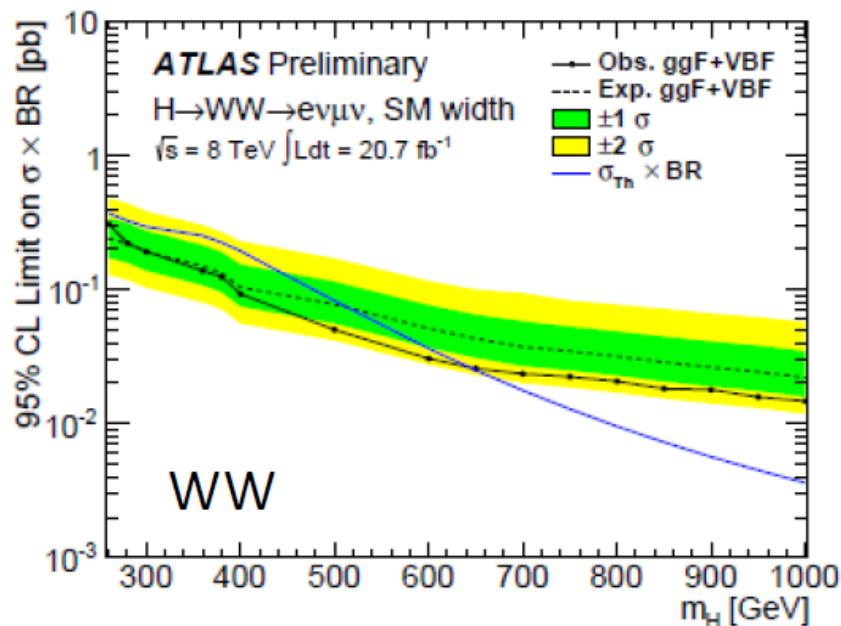

Value of test statistic,  $q$ , as a function of the  $q\bar{q}$  production fraction,  $f_{q\bar{q}}$

# Search for High Mass $H \rightarrow ZZ, WW$

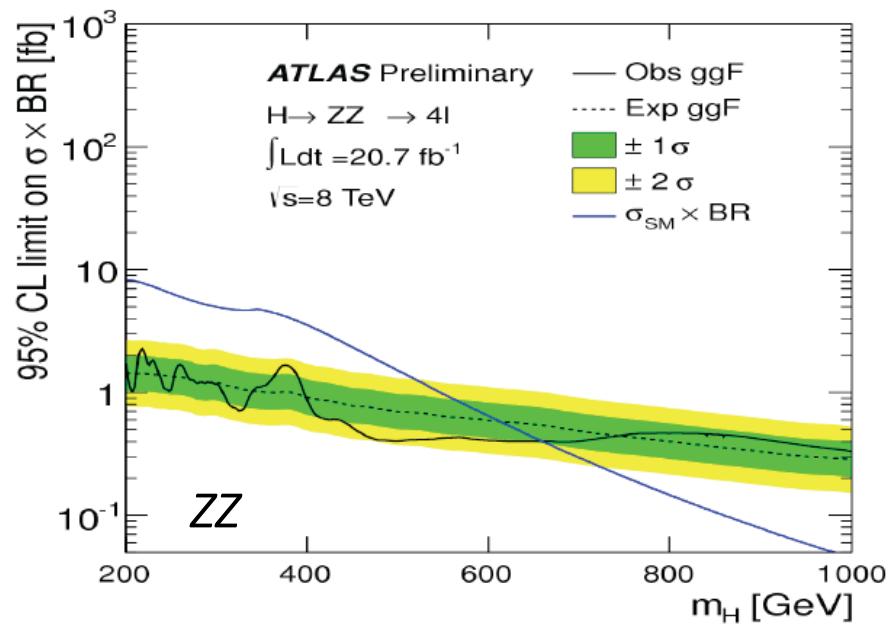

ATLAS-CONF-2013-067

Extend the Higgs search to high mass assume SM-like width, and decay to WW/zz

$$WW^* \rightarrow l\nu l\nu$$

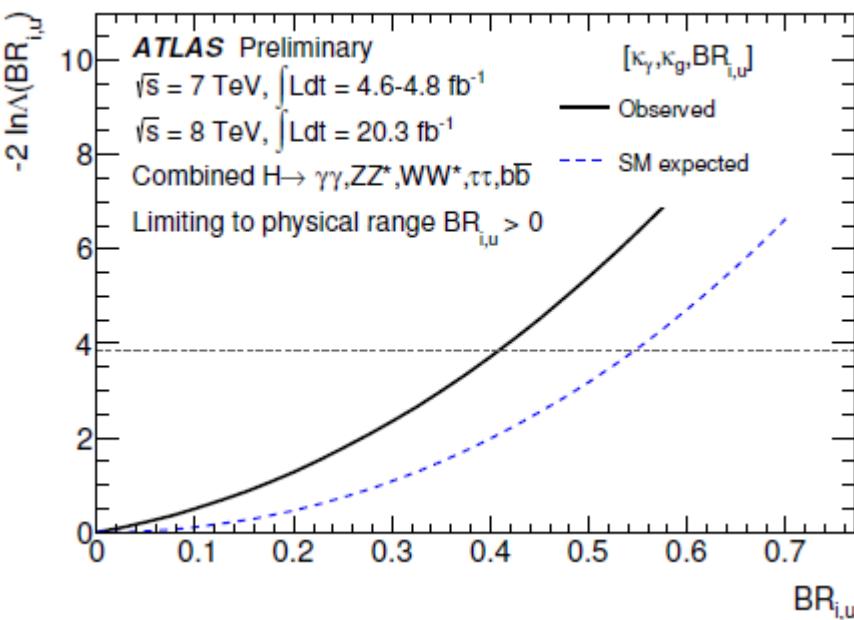

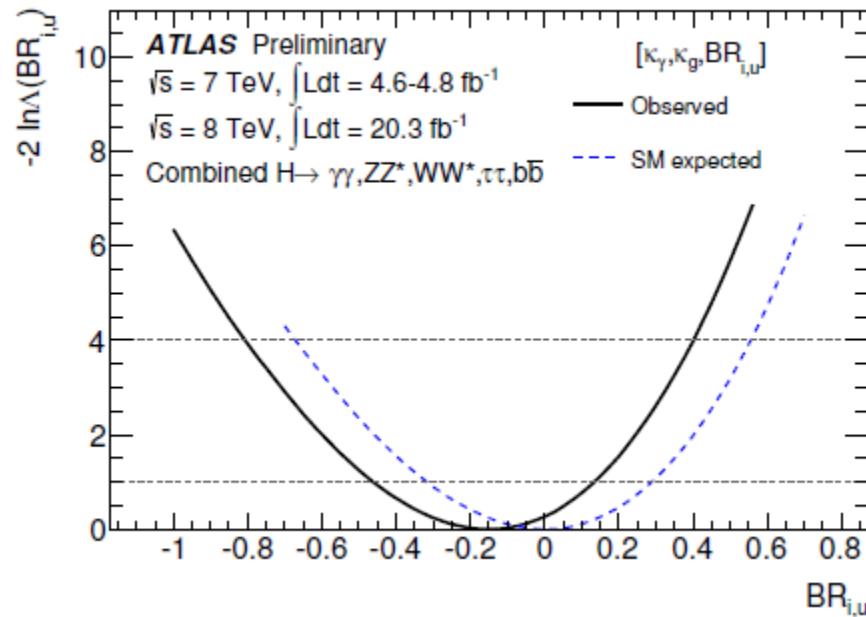

$$ZZ^* \rightarrow 4l$$

95% C.L. exclusion of a SM-like heavy Higgs up to  $\sim 650$  GeV

# Constraints on BSM Loops

**New particles may contribute to loops**

- Introduce effective  $\kappa_g$ ,  $\kappa_\gamma$  to allow heavy BSM particles contribute to the loops
- Tree-level couplings:  $\kappa_W, \kappa_Z, \kappa_t, \kappa_b, \kappa_\tau$  set to 1
  - Absorb all difference into loop couplings
  - Indirectly fixed normalization of Higgs width

$$\Gamma_H = \frac{\kappa_H^2(\kappa_i)}{(1 - BR_{i,u})} \Gamma_H^{\text{SM}}$$

$$\kappa_g = 1.00^{+0.23}_{-0.16}$$

$$\kappa_\gamma = 1.17^{+0.16}_{-0.13}$$

$$BR_{i,u} = -0.16^{+0.29}_{-0.30}$$

# ATLAS Trigger

Table 9: Summary of the triggers that are used during the 2012 data taking for the three analysis channels. When multiple chains are indicated, it is intended that the OR among them is requested.

Channel	Single-lepton	Di-lepton
4e	e24vhi_medium1, e60_medium1	2e12Tvh_loose1, 2e12Tvh_loose1_L2StarB(only data)
4 $\mu$	mu24i_tight, mu36_tight	2mu13, mu18_mu8_EFFS
2e2 $\mu$	4 $\mu$ OR 4e OR e12Tvh_medium1_mu8 OR e24vhi_loose1_mu8	

Table 10: Summary of the triggers that are used during the 2011 data taking. In each data taking period, the OR of single and di-lepton triggers is used to select each signature.

Period	Single-lepton triggers			
	B-I	J	K	L-M
4 $\mu$	EF_mu18_MG	EF_mu18_MG_medium	EF_mu18_MG_medium	EF_mu18_MG_medium
4e	EF_e20_medium	EF_e20_medium	EF_e22_medium	EF_e22vh_medium1
2e2 $\mu$		4 $\mu$ OR 4e		
Di-lepton triggers				
Period	B-I	J	K	L-M
4 $\mu$	EF_2mu10_loose	EF_2mu10_loose	EF_2mu10_loose	EF_2mu10_loose
4e	EF_2e12_medium	EF_2e12_medium	EF_2e12T_medium	EF_2e12Tvh_medium
2e2 $\mu$		4 $\mu$ OR 4e OR EF_e10_medium_mu6		

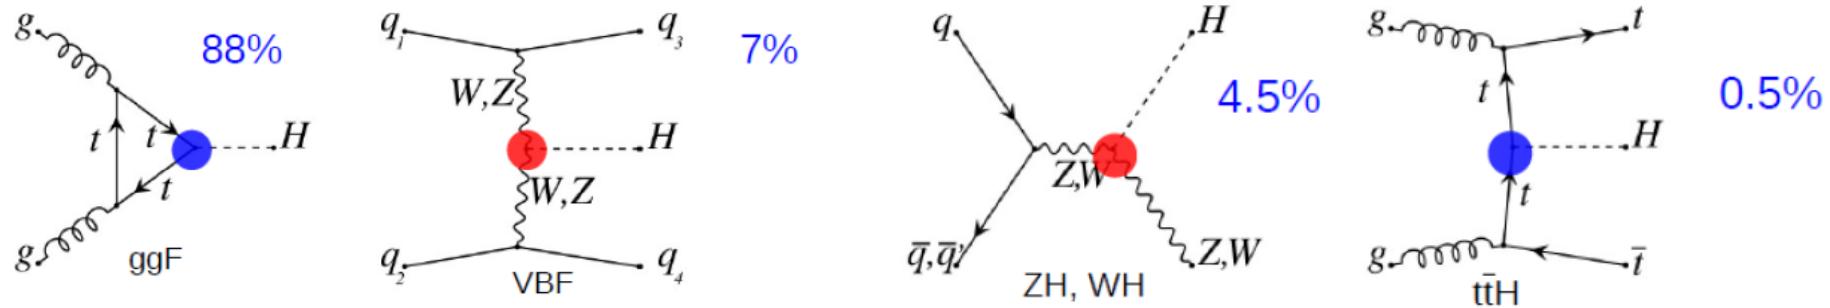

# Higgs Production and Decays

Table 2: Higgs boson production cross sections for gluon fusion, vector-boson fusion and associated production with a  $W$  or  $Z$  boson in  $pp$  collisions at  $\sqrt{s}$  of 7 TeV and 8 TeV [11]. The quoted uncertainties correspond to the total theoretical systematic uncertainties with linear sum of QCD scale and PDF+ $\alpha_s$  uncertainties. The production cross section for the associated production with a  $W$  or  $Z$  boson is negligibly small for  $m_H > 300$  GeV. The decay branching ratio for  $H \rightarrow 4\ell$ , with  $\ell = e$  or  $\mu$ , is reported in the last column [11].

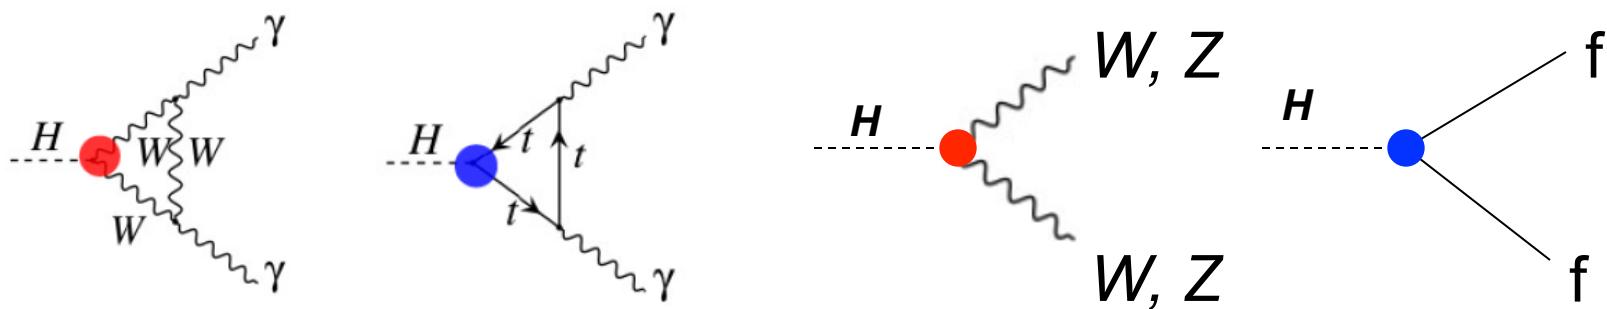

$m_H$ [GeV]	$\sigma(gg \rightarrow H)$ [pb]	$\sigma(qq' \rightarrow Hqq')$ [pb]	$\sigma(q\bar{q} \rightarrow WH)$ [pb]	$\sigma(q\bar{q} \rightarrow ZH)$ [pb]	$\text{BR}(H \rightarrow ZZ^{(*)} \rightarrow 4\ell)$ $[10^{-3}]$
$\sqrt{s} = 7$ TeV					
123	$15.8^{+2.3}_{-2.4}$	$1.25 \pm 0.03$	$0.60^{+0.02}_{-0.03}$	$0.33 \pm 0.02$	0.103
125	$15.3 \pm 2.3$	$1.22 \pm 0.03$	$0.57 \pm 0.02$	$0.32 \pm 0.02$	0.125
127	$14.9 \pm 2.2$	$1.20 \pm 0.03$	$0.54 \pm 0.02$	$0.30 \pm 0.02$	0.148
$\sqrt{s} = 8$ TeV					
123	$20.2 \pm 3.0$	$1.61 \pm 0.05$	$0.73 \pm 0.03$	$0.42 \pm 0.02$	0.103
125	$19.5 \pm 2.9$	$1.58^{+0.04}_{-0.05}$	$0.70 \pm 0.03$	$0.39 \pm 0.02$	0.125
127	$18.9 \pm 2.8$	$1.55 \pm 0.05$	$0.66^{+0.02}_{-0.03}$	$0.37 \pm 0.02$	0.148

# Is it the SM Higgs Boson?

## ❖ Higgs production ( $m_H = 125$ GeV)

## ❖ Higgs decays

## ❖ Couplings (new force!)

● : fermions  
● : vector bosons

$g_F$  (Yukawa coupling) =  $\sqrt{2} \times m_F/\nu$   
 $g_V$  (Gauge coupling) =  $2m_V^2/\nu$   
( $\nu$  is the vacuum expectation value)

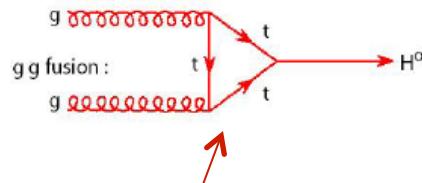

## ❖ Spin and Parity

# Coupling Measurements

Coupling strengths  $\kappa_i$  & ratio:  $\kappa_F = g_F/g_{F,SM}$ ,  $\kappa_V = g_V/g_{V,SM}$ ,  $\lambda_{ij} = \kappa_i / \kappa_j$

Model	Probed couplings	Parameters of interest	Functional assumptions					Example: $gg \rightarrow H \rightarrow \gamma\gamma$
			$\kappa_V$	$\kappa_F$	$\kappa_g$	$\kappa_\gamma$	$\kappa_H$	
1	Couplings to fermions and bosons	$\kappa_V, \kappa_F$	✓	✓	✓	✓	✓	$\kappa_F^2 \cdot \kappa_\gamma^2(\kappa_F, \kappa_V) / \kappa_H^2(\kappa_F, \kappa_V)$
2		$\lambda_{FV}, \kappa_{VV}$	✓	✓	✓	✓	-	$\kappa_{VV}^2 \cdot \lambda_{FV}^2 \cdot \kappa_\gamma^2(\lambda_{FV}, \lambda_{FV}, \lambda_{FV}, 1)$
3	Custodial symmetry	$\lambda_{WZ}, \lambda_{FZ}, \kappa_{ZZ}$	-	✓	✓	✓	-	$\kappa_{ZZ}^2 \cdot \lambda_{FZ}^2 \cdot \kappa_\gamma^2(\lambda_{FZ}, \lambda_{FZ}, \lambda_{FZ}, \lambda_{WZ})$
4		$\lambda_{WZ}, \lambda_{FZ}, \lambda_{\gamma Z}, \kappa_{ZZ}$	-	✓	✓	-	-	$\kappa_{ZZ}^2 \cdot \lambda_{FZ}^2 \cdot \lambda_{\gamma Z}^2$
5	Vertex loops	$\kappa_g, \kappa_\gamma$	=1	=1	-	-	✓	$\kappa_g^2 \cdot \kappa_\gamma^2 / \kappa_H^2(\kappa_g, \kappa_\gamma)$

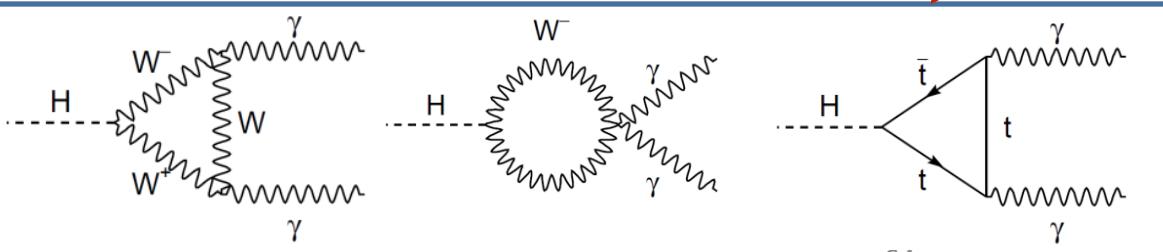

Example  $H \rightarrow \gamma\gamma$

$$(\sigma \cdot \text{BR})(gg \rightarrow H \rightarrow \gamma\gamma) = \sigma_{\text{SM}}(gg \rightarrow H) \cdot \text{BR}_{\text{SM}}(H \rightarrow \gamma\gamma) \cdot \frac{\kappa_g^2 \cdot \kappa_\gamma^2}{\kappa_H^2}$$

$\kappa_g, \kappa_\gamma$ : loop coupling scale factors

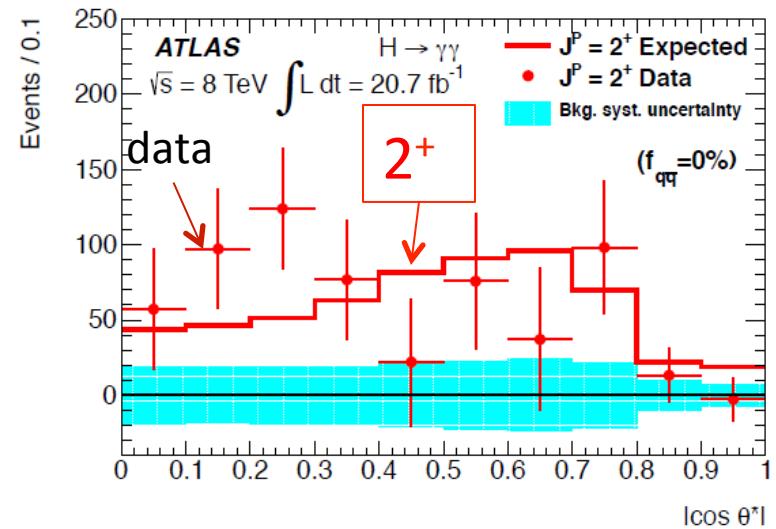

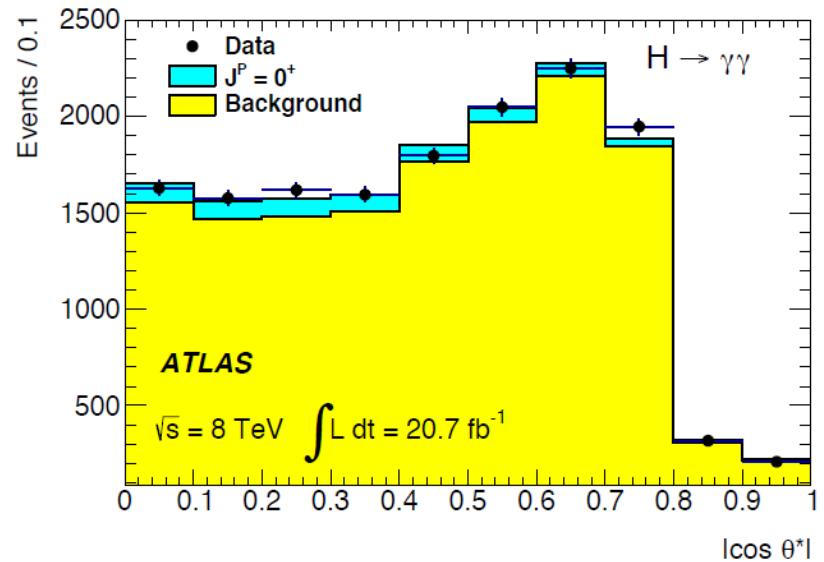

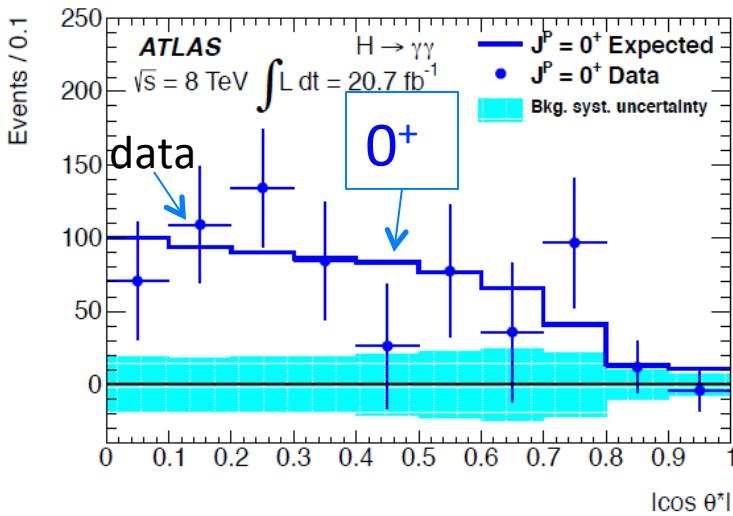

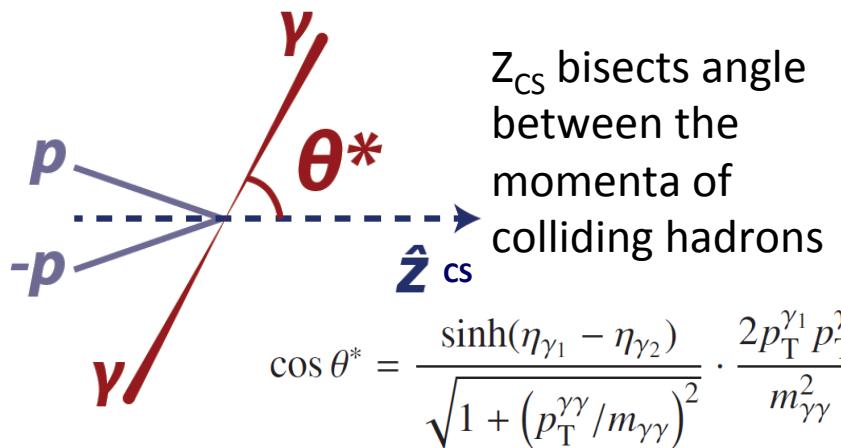

$\kappa_H$  is the total Higgs width scale factor

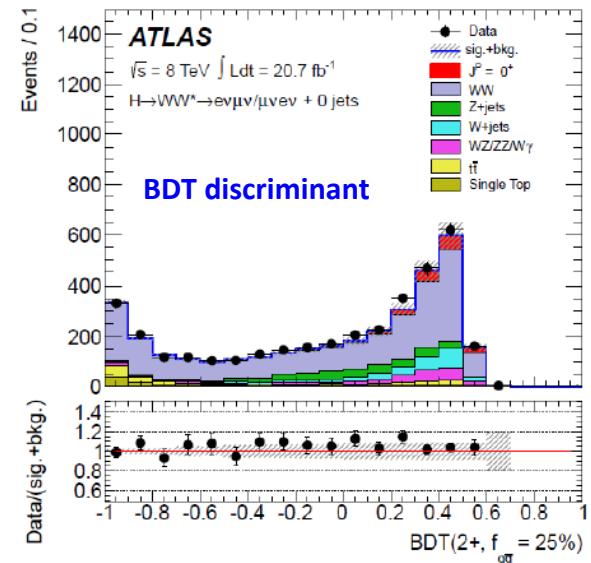

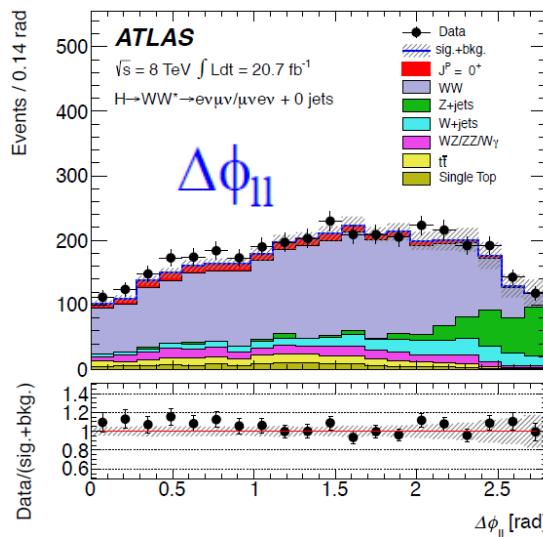

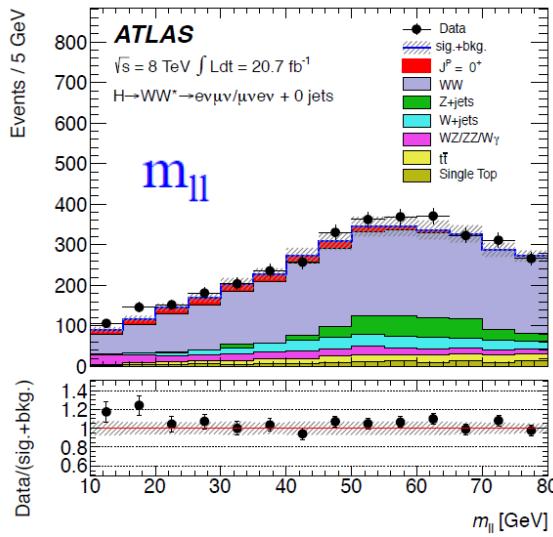

$$\kappa_\gamma^2 = |1.28 \kappa_W - 0.28 \kappa_t + \dots|^2$$

# Spin Analysis with $H \rightarrow \gamma\gamma$

Polar angle  $\theta^*$  of the photon decay in Collines-Soper frame, along with  $m_{\gamma\gamma}$

# Spin Analysis With $H \rightarrow WW^*$

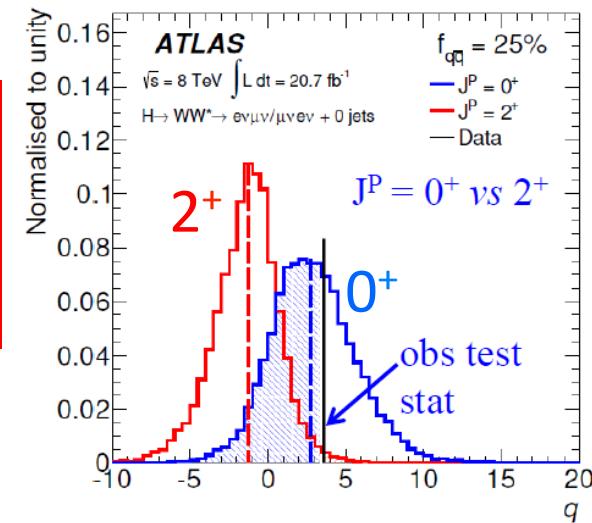

$J^P = 0^+ \text{ vs } 2^+$
